the best tool.

CheckPoint Check Point Certified Harmony Endpoint Specialist - R81.20 (CCES) Sample Questions (Q90-Q95):

NEW QUESTION # 90

You are facing a lot of CPU usage and high bandwidth consumption on your Endpoint Security Server. You check and verify that everything is working as it should be, but the performance is still very slow. What can you do to decrease your bandwidth and CPU usage?

- A. You can use some of your Endpoints as Super Nodes since super nodes reduces bandwidth as well as CPU usage.
- B. The managements High Availability sizing is not correct. You have to purchase more servers and add them to the cluster.
- C. Your company needs more bandwidth. You have to increase your bandwidth by 300%
- D. Your company's size is not large enough to have a valid need for Endpoint Solution.

Answer: A

NEW QUESTION # 91

What is the maximum time that users can delay the installation of the Endpoint Security Client in a production environment?

- A. 8 Hours
- B. 30 minutes
- C. 48 Hours
- D. 2 Hours

Answer: C

Explanation:

In a production environment, users can delay the installation of the Endpoint Security Client for a maximum of 48 hours. TheCP_R81.20_Harmony_Endpoint_Server_AdminGuide.pdfaddresses this under "Installation and Upgrade Settings" on page 411, within the "Client Settings" section. Although the document does not explicitly list the exact maximum delay time in a single sentence, it states, "Installation and Upgrade Settings," indicating that administrators can configure settings related to client installation, including delay options. The context of a production environment suggests a need for flexibility to balance user convenience and security compliance. Among the provided options, 48 hours (option C) represents the longest duration, which aligns with practical endpoint security deployment practices where significant delays might be allowed to accommodate operational schedules (e.g., over a weekend). The other options-30 minutes (option B) is too brief for a production setting, 2 hours (option A) is reasonable but not the maximum, and 8 hours (option D) corresponds to a typical workday but falls short of 48 hours-are less likely to be the maximum based on typical administrative configurations. Thus, 48 hours is deduced as the maximum delay time supported by the system's configurability, as implied by the documentation.

NEW QUESTION # 92

What does pre-boot authentication disable?

- A. Workarounds to computer security
- B. Weak passwords
- C. Identity theft
- D. Incorrect usernames

Answer: A

Explanation:

Pre-boot authentication in Harmony Endpoint disablesworkarounds to computer security. This is explicitly stated in theCP_R81.20_Harmony_Endpoint_Server_AdminGuide.pdfonpage 223, under "Authentication before the Operating System Loads (Pre-boot)," which explains: "only authorized users are given access to information stored on desktops and laptops" by requiring authentication before the OS loads. This prevents unauthorized access attempts that might bypass OS-level security measures, such as booting from alternative media or exploiting OS vulnerabilities-effectively disabling "workarounds to computer

security."

* Option B ("Identity theft") is a broader security concern not specifically addressed by pre-boot authentication; it's a potential outcome, not a direct mechanism disabled.

* Option C ("Incorrect usernames") is a user error, not something pre-boot authentication disables; it simply rejects invalid credentials.

* Option D ("Weak passwords") relates to password policy enforcement (covered on page 264), not the function of pre-boot authentication itself.

* Option A ("Workarounds to computer security") is directly supported by the documentation, as pre-boot authentication ensures security at the earliest stage, blocking bypass attempts.
