### Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q263-Q268):

#### NEW QUESTION # 263

An application uses Amazon Kinesis Data Streams to ingest and process large streams of data records in real time. Amazon EC2 instances consume and process the data from the shards of the Kinesis data stream by using Amazon Kinesis Client Library (KCL). The application handles the failure scenarios and does not require standby workers. The application reports that a specific shard is receiving more data than expected. To adapt to the changes in the rate of data flow, the "hot" shard is resharded. Assuming that the initial number of shards in the Kinesis data stream is 4, and after resharding the number of shards increased to 6, what is the maximum number of EC2 instances that can be deployed to process data from all the shards?

- A. 0
- **B. 1**
- C. 2
- D. 3

**Answer: B**

#### NEW QUESTION # 264

EC2 instances are launched from Amazon Machine images (AMIs). A given public AMI can:

- A. be used to launch EC2 Instances in any AWS region.
- B. only be used to launch EC2 instances in the same country as the AMI is stored.
- C. only be used to launch EC2 instances in the same AWS availability zone as the AMI is stored
- **D. only be used to launch EC2 instances in the same AWS region as the AMI is stored.**

**Answer: D**

#### NEW QUESTION # 265

When should a user try to Force Detach an EBS volume?

- A. If the volume is not unmounted and the user still wants to detach
- B. If the volume is a root volume
- **C. If the volume is stuck in a detaching state**
- D. If the volume is not accessible from the instance

**Answer: C**

Explanation:

If an EBS volume stays in the detaching state, the user can force the detachment by clicking Force Detach. Forcing the detachment can lead to either data loss or a corrupted file system. The user should use this option only as a last resort to detach a volume from a failed instance or if he is detaching a volume with the intention of deleting it.

#### NEW QUESTION # 266

A user has setup an application on EC2 which uses the IAM user access key and secret access key to make secure calls to S3. The user wants to temporarily stop the access to S3 for that IAM user. What should the root owner do?

- A. Change the access key and secret access key for the users
- B. Stop the instance
- C. Delete the IAM user
- **D. Disable the access keys for the IAM user**

**Answer: D**

Explanation:

If the user wants to temporarily stop the access to S3 the best solution is to disable the keys. Deleting the user will result in a loss of all the credentials and the app will not be useful in the future. If the user stops the instance IAM users can still access S3. The change of the key does not help either as they are still active. The best possible solution is to disable the keys.

#### NEW QUESTION # 267

A Developer has implemented a Lambda function that needs to add new customers to an RDS database that is expected to run hundreds of times per hour. The Lambda function is configured to use 512MB of RAM and is based on the following pseudo code:

```
def lambda_handler(event, context):  
  
    db = database.connect()  
    db.statement('INSERT INTO Customers (CustomerName) VALUES  
    (context.name)')  
  
    db.close()
```

After testing the Lambda function, the Developer notices that the Lambda execution time is much longer than expected. What should the Developer do to improve performance?

- A. Replace RDS with Amazon DynamoDB to implement control over the number of writes per second.
- B. Increase the amount of RAM allocated to the Lambda function, which will increase the number of threads the Lambda can use.
- **C. Increase the size of the RDS database to allow for an increased number of database connections each hour.**
- D. Move the database connection and close statement out of the handler. Place the connection in the global space.

**Answer: C**
