Oracle Cloud Database Services 2025 Professional Sample Questions (Q45-Q50):

NEW QUESTION # 45

You need to implement a backup and recovery strategy for your MySQL HeatWave Database System. What is the recommended method for backing up and restoring your HeatWave cluster?

- A. Manually copying the data files from the HeatWave cluster's storage.
- B. Using the OCI Object Storage service for storing manual database dumps.
- C. Relying solely on MySQL replication to another MySQL instance.
- **D. Utilizing OCI Database backups, which include both the MySQL Database System and the HeatWave cluster.**
- E. Using the MySQL Enterprise Backup tool directly on the HeatWave nodes.

Answer: D

Explanation:

C: Utilizing OCI Database backups:

- * Integrated with Oracle Cloud Infrastructure (OCI), providing consistent and complete backups.
- * Supports both the MySQL Database System and the HeatWave cluster, ensuring data integrity.
- * Automates backup scheduling and retention policies.
- * Facilitates easy restoration in case of data loss or corruption.

Why the other options are incorrect:

- * A. Manual copying: Prone to errors and lacks consistency.
- * B. Manual dumps to Object Storage: Labor-intensive and not automated.
- * D. MySQL replication: Suitable for high availability, but not a substitute for regular backups.
- * E. MySQL Enterprise Backup on nodes: Complex and not designed for HeatWave's distributed environment.

NEW QUESTION # 46

Which statement BEST describes the primary architectural distinction between Exadata Database Service and a traditional Oracle Database deployed on virtual machines in the cloud?

- A. Exadata Database Service exclusively supports Oracle RAC, while traditional cloud deployments can support both single-instance and RAC databases.
- B. Exadata Database Service utilizes only virtualized compute nodes, while traditional deployments use bare metal.
- **C. Exadata Database Service integrates specialized, high-performance storage servers and a high-bandwidth, low-latency RDMA over Converged Ethernet (RoCE) network, optimized for database workloads, which are not present in typical cloud VM deployments.**
- D. Exadata Database Service uses a completely different SQL parsing engine compared to a traditional Oracle Database.

Answer: C

Explanation:

Exadata's Unique Architecture:

Exadata Database Service is engineered specifically for Oracle Database workloads. The architecture leverages specialized storage servers that perform data-intensive operations at the storage level (such as filtering and aggregation), reducing the amount of data sent to the compute nodes.

The RoCE network (RDMA over Converged Ethernet) provides high-bandwidth, low-latency connectivity between compute and storage nodes, significantly enhancing I/O performance. This architecture is optimized for both OLTP and OLAP workloads, making Exadata a superior choice for performance-critical applications.

Why the other options are incorrect:

- * A: Exadata combines both virtualized and bare metal compute nodes.
- * C: Both Exadata and traditional cloud deployments can support Oracle RAC, but Exadata is optimized for it.
- * D: Exadata uses the same Oracle Database SQL parsing engine; the difference lies in the optimized hardware.

NEW QUESTION # 47

Which data formats are directly supported by the HeatWave Lakehouse feature for querying data in object storage?

- **A. CSV, Parquet, and Avro files.**
- B. Only CSV (Comma Separated Values) files.
- C. Only Parquet files.
- D. Only JSON files.
- E. Only XML files.

Answer: A

Explanation:

C: CSV, Parquet, and Avro files:

- * HeatWave Lakehouse can directly query data stored in OCI Object Storage without loading it into MySQL.
- * Supports widely-used data formats:
- * CSV (Comma Separated Values): Simple, text-based data format.
- * Parquet: Columnar storage format optimized for analytical queries.
- * Avro: Row-oriented format used for data serialization.
- * This versatility allows integrating data from various sources and querying directly.

Why the other options are incorrect:

- * A. Only CSV files: HeatWave supports more than just CSV.
- * B. Only Parquet files: HeatWave also supports CSV and Avro.
- * D. Only JSON files: JSON is not directly supported by HeatWave Lakehouse.
- * E. Only XML files: XML is not directly supported.

NEW QUESTION # 48

Which component aids in assessing the readiness of a MySQL instance for migration to MySQL HeatWave, specifically identifying potential compatibility issues?

- A. Oracle SQL Developer
- B. MySQL Enterprise Monitor
- C. Oracle Cloud Advisor
- D. MySQL Workbench
- **E. MySQL Shell Upgrade Checker Utility**

Answer: E

Explanation:

C: MySQL Shell Upgrade Checker Utility:

- * The utility analyzes MySQL instances for compatibility with newer versions, such as MySQL 8.0 used by HeatWave.
- * It checks for:
- * Syntax differences
- * Data type mismatches
- * Deprecated features
- * The tool outputs a report highlighting issues that may impact migration to HeatWave.

Why the other options are incorrect:

- * A. MySQL Enterprise Monitor: Focuses on monitoring performance, not compatibility.
- * B. Oracle SQL Developer: Primarily used for database development, not upgrade checks.
- * D. Oracle Cloud Advisor: Provides cloud optimization recommendations, not MySQL compatibility checks.
- * E. MySQL Workbench: A visual tool for database design and administration, not specifically for upgrade assessment.

NEW QUESTION # 49

What primary security mechanism within Oracle NoSQL Database Cloud Service governs access to individual tables, dictating which users or groups can perform specific actions?

- **A. Identity and Access Management (IAM) policies**
- B. Database Vault
- C. Virtual Cloud Network (VCN) security lists
- D. Transparent Data Encryption (TDE)

Answer: A

Explanation:

IAM Policies:

Oracle NoSQL Database Cloud Service uses OCI IAM policies to control access to tables. These policies specify who (user or group) can perform what actions (read, write, delete) on specific database resources. This centralized approach allows for granular permission control, supporting the principle of least privilege.

IAM policies are configured at the OCI tenancy level and can be customized to define access based on users, groups, and dynamic

groups. They are essential for maintaining secure data access, especially in multi-tenant environments.

Why the other options are incorrect:

* A:VCN security lists control network traffic, not table-level access.

* C:Database Vault is for fine-grained access control within traditional Oracle Databases, not NoSQL.

* D:TDE handles data encryption, not access management.
