## Fortinet NSE 5 - FortiSASE and SD-WAN 7.6 Core Administrator Sample Questions (Q21-Q26):

### NEW QUESTION # 21

Which statement is true about FortiSASE supported deployment?

- A. FortiSASE supports both Endpoint mode and SWG mode, depending on deployment.
- B. FortiSASE supports VPN mode and Agentless mode, based on user requirements.
- C. FortiSASE operates only in SWG mode, where all traffic is forced through FortiSASE POPs.
- D. FortiSASE relies on ZTNA-only mode, which replaces SWG and endpoint functions.

**Answer: A**

Explanation:

FortiSASE supports multiple deployment options, including Endpoint mode (using FortiClient) and SWG mode (agentless), allowing organizations to choose the method that best fits their access and security requirements.

### NEW QUESTION # 22

An administrator is configuring SD-WAN to load balance their network traffic. Which two things should they consider when setting up SD-WAN? (Choose two.)

- A. Only the manual and lowest cost (SLA) strategies allow SD-WAN load balancing.
- B. SD-WAN load balancing is possible only when using the manual and the best quality strategies.
- C. You can select the outbandwidth hash mode with all strategies that allow load balancing.
- D. When applicable, FortiGate load balances traffic through all members that meet the SLA target.

**Answer: C,D**

Explanation:

FortiGate load balances traffic across all members that meet the SLA targets, depending on the strategy used.

The outbandwidth hash mode can be selected with load-balancing strategies to distribute traffic based on flow characteristics.

### NEW QUESTION # 23

Which three factors about SLA targets and SD-WAN rules should you consider when configuring SD-WAN rules? (Choose three.)

- A. SLA targets are used only by SD-WAN rules that are configured with a Lowest Cost (SLA) strategy.
- B. Member metrics are measured only if a rule uses the SLA target.
- C. When configuring an SD-WAN rule, you can select multiple SLA targets from different performance SLAs.
- D. SD-WAN rules can use SLA targets to check whether the preferred members meet the SLA requirements.
- E. When configuring an SD-WAN rule, you can select multiple SLA targets if they are from the same performance SLA.

**Answer: A,D,E**

Explanation:

The use of SLA targets is specific to certain SD-WAN strategies. The "Lowest Cost (SLA)" and "Maximize Bandwidth (SLA)" strategies are explicitly designed to use the configured SLA targets to make routing decisions. The "Best Quality" strategy uses performance metrics but does not necessarily require or reference SLA targets in the same way, while "Manual" does not use metrics at all for path selection.

This is a core function of SD-WAN rules with SLA targets. The purpose of configuring an SLA target with specific thresholds for latency, jitter, and packet loss is to define what is considered

"acceptable" performance for an application. SD-WAN rules then use these targets to check if the members (interfaces) meet these requirements before a flow is steered over them, ensuring that a preferred path still offers a good user experience.

FortiGate allows for a single SD-WAN rule to reference multiple, different performance SLAs. This is crucial for complex deployments where a single SD-WAN rule needs to handle traffic for multiple applications that have distinct performance requirements. For example, a single rule might direct VoIP traffic based on one performance SLA with strict latency/jitter targets, while simultaneously handling general web traffic using another performance SLA with more lenient requirements.

#### NEW QUESTION # 24

Which FortiSASE feature monitors SaaS application performance and connectivity to points of presence (POPs)?

- A. FortiView dashboards
- B. Event logs
- C. Digital experience monitoring
- D. Operations widgets

**Answer: C**

Explanation:

According to the FortiSASE 7.6 Administration Guide and Digital Experience Monitoring (DEM) documentation, the feature specifically designed to monitor SaaS application performance and connectivity to PoPs is Digital Experience Monitoring (DEM).

\* SaaS and Path Visibility: DEM assists administrators in troubleshooting remote user connectivity issues by providing enhanced health check visibility for SaaS applications, endpoint devices, and the network path. It provides real-time insights into application performance and latency issues.

\* PoP Connectivity: It monitors the digital journey from the end-user device through the Security Points of Presence (POPs) to the final application, identifying hops where degraded service (packet loss, delay, or jitter) is detected.

\* Proactive Management: By establishing thresholds and simulating user activities through Synthetic Transaction Monitoring (STM), DEM allows IT teams to identify performance problems before they impact the business.

Why other options are incorrect:

- \* Option A: Operations widgets provide general status overviews but do not offer the granular per-hop path analysis or specific SaaS transaction monitoring found in DEM.
- \* Option B: FortiView dashboards provide traffic visibility and session data but are not dedicated performance monitoring tools for end-to-end digital experience.
- \* Option C: Event logs record system occurrences and security events but do not provide real-time performance metrics or health check probes for SaaS applications.

#### NEW QUESTION # 25

Which two delivery methods are used for installing FortiClient on a user's laptop? (Choose two.)

- A. Download the installer directly from the FortiSASE portal.
- B. Configure automatic installation through an API to the user's laptop.
- C. Use zero-touch installation through a third-party application store.
- D. Send an invitation email to selected users containing links to FortiClient installers.

**Answer: A,D**
