The JSON data in the exhibit has been parsed and stored into a variable "data". What returns the value "172.16.0.11"?

A. data["items"][1]["host"]["value"]  
B. data["items"][1]["host"]["value"]  
C. data["items"][0]["host"]["value"]  
D. data["items"]["host"][1]

Correct Answer: C

**QUESTION 8**

Refer to the exhibit.

```
import requests
from requests.auth import HTTPBasicAuth
from config import url, username, password
response = requests.login(url, auth=HTTPBasicAuth(username, password), verify=False)
print response.status_code
```

The script returns an output of 401. To use the supplied URL, an HTTP GET request must be sent with an Authorization header. The header value is a Base64 encoded concatenation of the username and password. Which action must be taken to return an output of 200?

A. Change the verify=False setting in the request to verify=True to enable HTTP Basic authentication  
B. Modify the method from LOGIN to GET and supply the username:password value as JSON payload  
C. Verify that the username and password values imported from the configuration file are still valid.  
D. Insert an Authorization header with the values username:password from the supplied configuration file.

Correct Answer: B

This seems like a trick question. Simply changing "login" to "get" should fix it. You're still keeping the HTTPBasicAuth header intact while also sending the user/pass in the json payload according to this answer. Sending it in the payload shouldn't do anything since it's a simple GET. The payload will be ignored and the basic auth header will be used.
