Palo Alto Networks PCNSE Sample Test Online | PCNSE Actualtest

The Palo Alto Networks Certified Network Security Engineer Exam (PCNSE) dumps PDF file can be used from any location and at any time. Furthermore, you can take print of Palo Alto Networks Questions PDF to do an off-screen study. The web-based PCNSE practice exam can be taken via the internet from any browser like Firefox, Safari, Opera, MS Edge, Internet Explorer, and Chrome. You don't need to install any excessive plugins and software to take this Palo Alto Networks Certified Network Security Engineer Exam (PCNSE) practice test.

Palo Alto Networks Certified Network Security Engineer Exam Sample Questions (Q54-Q59):

NEW QUESTION # 54

Which two features can be used to tag a username so that it is included in a dynamic user group?
(Choose two.)

- A. GlobalProtect agent
- B. XML API
- C. User-ID Windows-based agent
- D. log forwarding auto-tagging

Answer: B,D

Explanation:

Dynamic user groups help you to create policy that provides auto-remediation for anomalous user behavior and malicious activity while maintaining user visibility. After you create the group and commit the changes, the firewall registers the users and associated tags then automatically updates the dynamic user group's membership. Because updates to dynamic user group membership are automatic, using dynamic user groups instead of static group objects allows you to respond to changes in user behavior or potential threats without manual policy changes.

To determine what users to include as members, a dynamic user group uses tags as filtering criteria. As soon as a user matches the filtering criteria, that user becomes a member of the dynamic user group. The tag-based filter uses logical `and` and `or` operators. Each tag is a metadata element or attribute-value pair that you register on the source statically or dynamically. Static tags are part of the firewall configuration, while dynamic tags are part of the runtime configuration. As a result, you don't need to commit updates to dynamic tags if they are already associated with a policy that you have committed on the firewall.

To dynamically register tags, you can use:

- the XML API
- the User-ID agent
- Panorama
- the web interface on the firewall

The firewall redistributes the tags for the dynamic user group to the listening redistribution agents, which includes other firewalls, Panorama, or a Dedicated Log Collector, as well as Cortex applications.

NEW QUESTION # 55

Four configuration choices are listed, and each could be used to block access to a specific URL. If you configured each choice to block the same URL, then which choice would be evaluated last in the processing order to block access to the URL?

- A. Custom URL category in Security policy rule
- B. Custom URL category in URL Filtering profile
- C. PAN-DB URL category in URL Filtering profile
- D. EDL in URL Filtering profile

Answer: C

NEW QUESTION # 56

An organization's administrator has the funds available to purchase more firewalls to increase the organization's security posture. The partner SE recommends placing the firewalls as close as possible to the resources that they protect.

Is the SE's advice correct, and why or why not?

- A. Yes. Firewalls are session-based, so they do not scale to millions of CPS.
- B. No. Placing firewalls in front of perimeter DDoS devices provides greater protection for sensitive devices inside the network.
- C. Yes. Zone Protection profiles can be tailored to the resources that they protect via the configuration of specific device types and operating systems.
- D. No. Firewalls provide new defense and resilience to prevent attackers at every stage of the cyberattack lifecycle, independent of placement.

Answer: A

Explanation:

<https://docs.paloaltonetworks.com/pan-os/10-2/pan-os-admin/zone-protection-and-dos-protection/zone-defense/firewall-placement-for-dos-protection> The firewall is a session-based device that isn't designed to scale to millions of connections-per-second (CPS) to defend against large volumetric DoS attacks.

NEW QUESTION # 57

The decision to upgrade to PAN-OS 10.2 has been approved. The engineer begins the process by upgrading the Panorama servers, but gets an error when trying to install.

When performing an upgrade on Panorama to PAN-OS 10.2, what is the potential cause of a failed install?

- A. Management only mode
- B. Outdated plugins
- C. GlobalProtect agent version
- D. Expired certificates

Answer: B

Explanation:

Explanation

<https://docs.paloaltonetworks.com/pan-os/11-0/pan-os-upgrade/upgrade-panorama-plugins/panorama-plugins-up> Before you upgrade to PAN-OS 11.0, you must download the Panorama plugin version supported on PAN-OS 11.0 for all plugins installed on Panorama. This is required to successfully upgrade to PAN-OS 11.0. See the Compatibility Matrix for more information.

NEW QUESTION # 58

Which statement best describes the Automated Commit Recovery feature?

- **A. It performs a connectivity check between the firewall and Panorama after every configuration commit on the firewall. It reverts the configuration changes on the firewall if the check fails.**
- B. It restores the running configuration on a firewall and Panorama if the last configuration commit fails.
- C. It performs a connectivity check between the firewall and Panorama after every configuration commit on the firewall. It reverts the configuration changes on the firewall and on Panorama if the check fails.
- D. It restores the running configuration on a firewall if the last configuration commit fails.

Answer: A

Explanation:

Explanation

<https://docs.paloaltonetworks.com/panorama/10-2/panorama-admin/administer-panorama/enable-automated-com> The Automated Commit Recovery feature enables the firewall to automatically revert to a previous configuration if a commit operation causes connectivity loss between the firewall and Panorama. The feature performs a connectivity check between the firewall and Panorama after every configuration commit on the firewall. If the check fails, the firewall reverts to the last known good configuration and restores connectivity with Panorama. The feature does not restore the running configuration on a firewall or Panorama if the last commit fails, as this would require manual intervention. The feature does not revert the configuration changes on Panorama, as Panorama is not affected by the commit operation on the firewall. References:
