## Salesforce Certified Development Lifecycle and Deployment Architect Development-Lifecycle-and-Deployment-Architect Prüfungsfragen mit

# Lösungen (Q195-Q200):

**195. Frage**

Cloud Kicks (CK) is launching a new sneaker line during the upcoming holiday season and needs to do a thorough batch data testing before Go-Live. CK is using Salesforce unlimited edition.

What two sandbox types should the architect recommend for batch data testing?

Choose 2 answers

- A. Developer Pro sandbox
- B. Developer sandbox
- C. Partial Copy sandbox
- D. Full sandbox

**Antwort: C,D**

**196. Frage**

Universal containers has proposed using a Developer Edition org to stage changes to their Customer Community, which includes multiple custom Visualforce pages and components. Which three risks should a Technical Architect consider in this strategy?

Choose 3 answers

- A. Changes Sets cannot be used to deploy from Developer Edition to Production which will make deployment more complex
- B. Developer Edition orgs do not run on production servers and will not perform well during testing.
- C. Code changes cannot be deployed from a Developer Sandbox to Production.
- D. Developer Edition orgs have limited user counts and low data volume limits, which will make User Testing difficult.
- E. Developer Edition orgs cannot have sandboxes, which will make team development difficult.

**Antwort: B,D,E**

**197. Frage**

Universal Containers CUC) has been on the org development model with scratch orgs are already enabled, but they haven't been taking advantage of the scratch orgs.

Now UC is ready to move to the package development model.

What step must be done by an administrator?

- A. In setup, switch both the Enable Dev Hub and Enable 2nd-Generation Managed Packages to Enabled.
- B. In setup, switch the Enable Unlocked Packages and Second-Generation Managed Packages to Enabled.
- C. In setup, switch the Enable Unlocked Packages to Enabled, keep the Enable Second-Generation Managed Packages as disabled.
- D. In setup, switch the Enable Dev Hub to Enabled, then switch the Enable Source Tracking for Scratch Orgs to Enabled.

**Antwort: A**

Begründung:

To move to the package development model, the administrator must enable both the Dev Hub and the Second- Generation Managed Packages in setup. The Dev Hub is the main org where the administrator can create and manage scratch orgs and packages. The Second-Generation Managed Packages are the new format of packages that support modular development and versioning. The Unlocked Packages are a type of second- generation packages that are not tied to a namespace and can be installed and customized in any org. The Source Tracking for Scratch Orgs is a feature that allows the administrator to track the changes made in a scratch org and push or pull them to or from a source repository.

**198. Frage**

Universal Containers is validating an outbound change set from the Developer Sandbox to the production org.

Which two locking behaviors will occur during a deployment? Choose 2 answers

- A. The production org will be locked. Administrators cannot modify metadata during this time
- B. The production org will be locked. Users can only Read data during this time
- C. The production org will be locked. Users will still be able to Read/Write data to the org

- D. The sandbox org will be locked. Administrators cannot modify metadata

**Antwort: A,C**

Begründung:
A and D are the correct answers, as they are the locking behaviors that will occur during a deployment. A is correct, as the production org will be locked and administrators cannot modify metadata during this time, to prevent any conflicts or inconsistencies in the deployment. D is correct, as the production org will be locked and users will still be able to read/write data to the org, to minimize the impact on the business operations and user experience. B is incorrect, as the sandbox org will not be locked and administrators can still modify metadata, as the sandbox org is not the target of the deployment. C is incorrect, as the production org will not be locked and users can only read data during this time, as this would disrupt the business operations and user experience. You can learn more about the locking behaviors in the [Deploy Changes with Change Sets] unit on Trailhead.

**199. Frage**
Universal Containers (UC) maintains its Salesforce org using its internal tools and processes for managing its application lifecycle. The UC team has been facing challenges on their development processes in their recent two releases. The architect has recommended the UC team to follow the org development model to address the challenges faced.
Which two characteristics of the org development model will help UCaddress the challenges?
Choose 2 answers

- A. Automated defect fixing
- B. Automated deployment
- C. Automated change tracking
- D. Automated sandbox provisioning

**Antwort: B,D**

Begründung:
The org development model is a traditional approach that uses sandboxes as the primary development environments. It relies on tools such as change sets, the Ant Migration Tool, or the Metadata API to deploy changes between orgs. One of the benefits of this model is that it allows automated deployment, meaning that the deployment process can be scripted and executed without manual intervention. This can save time and reduce errors. Another benefit of this model is that it allows automated sandbox provisioning, meaning that the creation and configuration of sandboxes can be done programmatically using the Sandbox API or the Salesforce CLI. This can help maintain consistency and alignment across different environments. Automated defect fixing and automated change tracking are not characteristics of the org development model, but rather of the package development model, which uses source code as the source of truth and supports source tracking and automated testing.
