EMC Dell PowerEdge Foundations v2 Exam Sample Questions (Q82-Q87):

NEW QUESTION # 82

Which feature is supported by the OCP 3.0 card in the latest 16G PowerEdge servers?

- A. Power consumption of 200 W
- B. Wake on LAN (WoL)
- C. PCIeGen3
- D. Maximum of two network ports

Answer: B

NEW QUESTION # 83

Which technology should a customer choose to directly connect an external storage array?

- A. SAS
- B. FCoE
- C. ESCON
- D. FICON

Answer: A

NEW QUESTION # 84

A data center technician is troubleshooting a server where multiple hard drives have become unresponsive simultaneously. Which server component failure is MOST likely to cause disconnection of multiple hard drives at once?

- A. Individual hard drive failure
- B. CPU failure
- C. The backplane failure
- D. PERC controller failure

Answer: C

Explanation:

The backplane in a PowerEdge server connects multiple hard drives to the system, and its failure can cause simultaneous disconnection of all attached drives, rendering them unresponsive. The backplane manages power and data pathways, so its malfunction disrupts multiple drives. CPU failure affects processing, not drive connectivity; individual drive failure typically impacts one drive; and PERC failure affects RAID but not physical connections. Backplane issues are critical in troubleshooting. Exact extract: "Explain the function of various storage components... Describe maintenance functions, shutdowns, reboots of a PowerEdge Server." Reference: Dell PowerEdge Foundations v2 Exam Description (D-PE-FN-01), Topic: Maintenance (18%).

NEW QUESTION # 85

Which type of servers are all-in-one chassis platforms that provide computer servers, network I/O modules, and storage devices?

- A. Modular Servers
- B. Software-Defined Servers

- C. Accelerated Servers
- D. Tower Servers

Answer: A

NEW QUESTION # 86

A data center is designed with cold aisle containment. How are cold aisles used in this design to manage server temperatures?

- A. Recirculate hot air within the cold aisle to preheat intake air.
- B. Direct hot exhaust air from the servers into the cold aisle.
- C. Isolate the cold aisle to prevent any airflow from the hot aisle.
- **D. Pump cold air into the cold aisle for server intake.**

Answer: D

Explanation:

In cold aisle containment designs, cold aisles are used to supply chilled air directly to server intakes by pumping cold air from air handlers or CRAC units into the enclosed cold aisle, ensuring efficient cooling and preventing mixing with hot exhaust air. This isolation improves energy efficiency and maintains optimal server temperatures. Directing hot air into the cold aisle or recirculating it would increase temperatures, defeating the purpose. Containment focuses on separating airflows for better thermal management in PowerEdge server deployments. Exact extract: "Explain the cooling and thermal considerations in PowerEdge Servers (Direct Liquid Cooling, Immersion Cooling, Air Cooling)... Describe maintenance functions, shutdowns, reboots of a PowerEdge Server."
