最新的 Microsoft Certified AI-300 免費考試真題 (Q35-Q40):

問題 #35

Hotspot Question

You manage an Azure Machine Learning workspace named workspace1 by using the Python SDK v2. You create a General Purpose v2 Azure storage account named mlstorage1. The storage account includes a publicly accessible container named mlcontainer1. The container stores 10 blobs with files in the CSV format.

You must develop Python SDK v2 code to create a data asset referencing all blobs in the container named mlcontainer1.

You need to complete the Python SDK v2 code.

How should you complete the code? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

問題 #36

A team is developing a generative AI assistant. The team is experimenting with multiple prompt variants to improve the user experience.

When comparing prompt variants, the team plans to assess whether the generated responses are grammatically correct.

You need to evaluate the quality of the language from the generated responses.

Which evaluator should you use?

- A. Coherence
- B. Grounded ness
- **C. Fluency**
- D. Textual similarity

答案: C

解題說明:

The best evaluator within the Microsoft ecosystem for checking the grammatical correctness of generative AI responses--especially when testing multiple prompt variants--is the Azure AI Evaluator for Fluency, available within Azure AI Foundry.

Fluency Evaluator (builtin.fluency)

Purpose: Specifically designed to measure the effectiveness and clarity of written communication.

Grammatical Focus: It assesses grammatical accuracy, sentence structure, punctuation, and vocabulary usage in AI-generated text.

Result: It provides a 1-5 Likert scale score, allowing you to compare which prompt variants produce the most grammatically correct, natural-sounding responses.

問題 #37

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear on the review screen.

You work in Microsoft Foundry with a prompt flow.

You must manually evaluate prompts and compare results across prompt variants.

You need to capture the inputs, outputs, token usage, and latencies for each flow run for the evaluation.

Solution: Create prompt variants and compare their outputs in the Evaluation experience.

Does the solution meet the goal?

- A. Yes
- **B. No**

答案: B

解題說明:

Correct:

* In Microsoft Foundry, turn on Tracing for the prompt flow of the project and execute test runs to produce trace data.

Incorrect:

* Create prompt variants and compare their outputs in the Evaluation experience.

* Use the prompt flow SDK to enable tracing for the flow before executing runs. Then run the flow to generate traceable results.

Note:

In Azure AI Foundry, you can capture and compare these metrics by enabling Tracing and using the Bulk Test feature. This allows you to systematically evaluate different prompt variants against a common dataset.

Steps to Evaluate and Compare Prompt Variants

*-> 1. Enable Tracing

Navigate to your Prompt Flow project.

Locate the Tracing toggle at the top of the flow authoring page.

Switch it to On.

This ensures every execution captures latency, token counts, and node-level inputs/outputs.

2. Create Prompt Variants

Within your flow, identify the LLM node you want to test.

Click Variants to create multiple versions of your prompt (e.g., Variant_0, Variant_1).

This allows you to test different instructions or few-shot examples side-by-side.

3. Run a Bulk Test (Evaluation)

4. Analyze the Results

問題 #38

You must ensure full reproducibility of experiments including dataset, code, and environment across multiple runs and workspaces. Which combination of practices is MOST appropriate?

- A. Dataset versioning only
- B. Logging metrics only
- C. Git only
- D. Environment + dataset + code versioning

答案： D

解題說明：

Reproducibility requires versioning all components: code, datasets, and environments. Missing any of these elements prevents exact replication of experiments. For example, the same code with different data or dependencies can produce different results, making debugging and auditing difficult.

問題 #39

Your ML pipeline contains independent feature engineering steps that currently execute sequentially, increasing overall runtime. You want to optimize execution without modifying logic.

What is the BEST solution?

- A. Enable parallel step execution
- B. Increase compute size
- C. Combine all steps
- D. Reduce dataset size

答案： A

解題說明：

Parallel execution allows independent pipeline steps to run simultaneously, reducing total execution time without altering logic. This is more efficient than increasing compute resources, which may raise costs without guaranteeing proportional performance improvements.
