CompTIA Network+ Certification Exam Sample Questions (Q60-Q65):

NEW QUESTION # 60

A technician is planning an equipment installation into a rack in a data center that practices hot aisle/cold aisle ventilation. Which of the following directions should the equipment exhaust face when installed in the rack?

- A. Sides
- B. Top
- C. Rear
- D. Front

Answer: C

Explanation:

In a data center that practices hot aisle/cold aisle ventilation, equipment should be installed so that the exhaust faces the rear of the rack. This setup ensures that hot air is expelled into the hot aisle, maintaining proper airflow and cooling efficiency.

Hot Aisle/Cold Aisle Configuration: Equipment intake should face the cold aisle where cool air is supplied, and exhaust should face the hot aisle where hot air is expelled.

Cooling Efficiency: Proper orientation of equipment helps maintain an efficient cooling environment by segregating hot and cold air, preventing overheating and improving energy efficiency.

NEW QUESTION # 61

Which of the following steps of the troubleshooting methodology comes after testing the theory to determine cause?

- A. Identify the problem
- B. Document the findings and outcomes.
- C. Establish a plan of action.
- D. Verify full system functionality.

Answer: C

Explanation:

The CompTIA Troubleshooting Methodology states that after testing the theory, the next step is to establish a plan of action to resolve the issue.

Troubleshooting Steps:

Identify the problem

Establish a theory of probable cause.

Test the theory to determine the cause.

Establish a plan of action and implement the solution. (Correct step) Verify full system functionality.

Document findings, actions, and outcomes.

Breakdown of Options:

A. Verify full system functionality - Happens after implementing the solution.

B. Document the findings and outcomes - Final step, happens after resolving the issue.

C. Establish a plan of action - Correct answer. Comes immediately after confirming the cause.

D. Identify the problem - First step, already completed.

NEW QUESTION # 62

Which of the following IP transmission types encrypts all of the transmitted data?

- A. UDP
- B. AH
- C. TCP
- D. GRE
- E. ESP

Answer: E

Explanation:

Definition of ESP (Encapsulating Security Payload):

ESP is a part of the IPsec protocol suite used to provide confidentiality, integrity, and authenticity of data.

ESP encrypts the payload and optional ESP trailer, providing data confidentiality.

ESP Functionality:

ESP can encrypt the entire IP packet, ensuring that the data within the packet is secure from interception or eavesdropping. It also provides options for data integrity and authentication.

ESP operates in two modes: transport mode (encrypts only the payload of the IP packet) and tunnel mode (encrypts the entire IP packet).

Comparison with Other Protocols:

AH (Authentication Header): Provides data integrity and authentication but does not encrypt the payload.

GRE (Generic Routing Encapsulation): A tunneling protocol that does not provide encryption.

UDP (User Datagram Protocol) and TCP (Transmission Control Protocol): These are transport layer protocols that do not inherently provide encryption. Encryption must be provided by additional protocols like TLS/SSL.

Use Cases:

ESP is widely used in VPNs (Virtual Private Networks) to ensure secure communication over untrusted networks like the internet.

NEW QUESTION # 63

Following a fire in a data center, an executive is concerned about the amount of data that must be reentered. Which of the following describes the executive's concern?

- A. RTO
- B. RPO
- C. MTBF
- D. MMTR

Answer: B

Explanation:

A recovery point objective (RPO) is the maximum length of time permitted that data can be restored from, which may or may not mean data loss. It is the age of the files or data in backup storage required to resume normal operations if a computer system or network failure occurs.

NEW QUESTION # 64

A network engineer configures a new switch and connects it to an existing switch for expansion and redundancy. Users immediately lose connectivity to the network. The network engineer notes the following spanning tree information from both switches:

Switch 1

Port State Cost

1 Forward 2

2 Forward 2

Switch 2

Port State Cost

1 Forward 2

2 Forward 2

Which of the following best describes the issue?

- A. A root bridge needs to be identified.
- B. The switch should be configured for RSTP.
- C. The ports should use link aggregation.
- D. The port cost should not be equal.

Answer: A

Explanation:

The issue is that no root bridge has been identified. In STP, a root bridge is necessary to manage redundant paths and avoid loops in the network. Without a root bridge, all switches will assume they can forward traffic, causing a network loop and connectivity problems.
