## Plat-Dev-301 Valid Exam Materials | Plat-Dev-301 Vce Free

The ExamPrepAway offers three formats for applicants to practice and prepare for the Plat-Dev-301 exam as per their needs. The pdf format of ExamPrepAway is portable and can be used on laptops, tablets, and smartphones. Print real Salesforce Certified Platform Developer II - Multiple Choice (Plat-Dev-301) exam questions in our PDF file. The pdf is user-friendly and accessible on any smart device, allowing applicants to study from anywhere at any time.

## Salesforce Certified Platform Developer II - Multiple Choice Sample Questions (Q172-Q177):

NEW QUESTION # 172

Universal Containers (UC) has an ERP system that stores customer Information, When an Account is created in Salesforce, the ERP system's REST endpoint for creating new customers must automatically be called with the Account information. If the call to the ERP system fails, the Account should still be created. Accounts in the UC org are only created, one at a time, by users in the UC customer on-boarding department.

What should a developer implement to make the call to the ERP system's REST endpoint?

- A. REST call from JavaScript
- B. Apex Continuation
- C. Headless Quick Action
- **D. Call a Queueable from a Trigger**

**Answer: D**

Explanation:

Since the requirement is to make a callout to an external ERP system when an Account is created and still allow for the Account creation even if the call fails, a Queueable class called from a trigger is the best solution. Queueable Apex allows you to submit jobs for asynchronous processing similar to future methods but with additional benefits such as chaining jobs and monitoring the job status.

By using a Queueable, the callout can be made after the Account is created, which respects the Salesforce order of execution and avoids the limitation of callouts not being allowed after DML operations in the same transaction. This approach also does not block the user interface or the creation of the Account record if the callout to the ERP system takes a long time or fails.

Salesforce Documentation on Queueable Apex: Using Queueable Apex to Perform Jobs  
Salesforce Developer Guide on Asynchronous Apex: Queueable Apex

#### NEW QUESTION # 173

After a platform event is defined in a Salesforce org, events can be published via which mechanism?

- A. External Apps require the standard Streaming API.
- **B. External Apps use an API to publish event messages.**
- C. Internal Apps can use entitlement processes.
- D. Internal Apps can use outbound messages.

**Answer: B**

Explanation:

Platform events in Salesforce can be published using a variety of mechanisms, including from external applications through the Salesforce APIs.

Option A is correct because external applications can use Salesforce APIs such as the REST API or the SOAP API to publish events to a platform event in Salesforce.

Options B, C, and D describe mechanisms that are not used for publishing platform events. Entitlement processes are for setting up and tracking service contracts, the standard Streaming API is for subscribing to events not publishing them, and outbound messages are a workflow action used to send information to external services, not for publishing platform events.

Salesforce Developer Documentation - Platform Events

#### NEW QUESTION # 174

A company uses an external system to manage its custom account territory assignments. Every quarter, millions of Accounts may be updated in Salesforce with new Owners when the territory assignments are completed in the external system.

What is the optimal way to update the Accounts from the external system?

- A. Bulk API
- **B. Apex REST Web Service**
- C. SOAP API
- D. Composite REST API

**Answer: B**

#### NEW QUESTION # 175

Refer to the code snippet below:

A custom object called Credit\_Memo\_\_c exists in a Salesforce environment. As part of a new feature development that retrieves and manipulates this type of record, the developer needs to ensure race conditions are prevented when a set of records are modified within an Apex transaction. In the preceding Apex code, how can the developer alter the query statement to use SOQL features to prevent race conditions within a transaction? A)

B)

C)

D)

- A. Option A
- B. Option D
- C. Option B
- D. Option C

**Answer: A**

Explanation:

To prevent race conditions during an Apex transaction, the SOQL query can be modified to include the "FOR UPDATE" keyword. This keyword locks the records that are returned by the query, preventing other transactions from modifying them until the current transaction is complete. This ensures that the retrieved records cannot be changed by another process before the current transaction is completed, thus preventing race conditions. The correct option to use in the code snippet provided is:

[SELECT Id, Name, Amount\_\_c FROM Credit\_Memo\_\_c WHERE Customer\_Id\_\_c = :customerId LIMIT 50 FOR UPDATE]

This will lock up to 50 records of Credit\_Memo\_\_c with the specified Customer\_Id\_\_c for the duration of the transaction.

FOR UPDATE

Preventing Record Update Conflicts

#### NEW QUESTION # 176

What should a developer use to query all Account fields for the Acme account in their sandbox?

- A. SELECT ALL FROM Account WHERE Name = 'Acme' LIMIT 1
- B. SELECT \* FROM Account WHERE Name = 'Acme' LIMIT 1
- C. SELECT FIELDS (ALL) FROM Account WHERE Name = 'Acme' LIMIT 1
- D. SELECT FIELDS FROM Account WHERE Name = 'Acme' LIMIT 1

**Answer: C**

Explanation:

The correct SOQL query to retrieve all fields for a specific Account is to use the FIELDS(ALL) function within the SELECT clause of the SOQL query. This will return all fields for the Account named 'Acme'.

#### NEW QUESTION # 177
