Salesforce Certified Sharing and Visibility Architect Sample Questions (Q45-Q50):

NEW QUESTION # 45

Universal Containers has Controlled by Parent sharing settings on the Contact object and Public Read Only sharing settings on Account, Opportunity, and Case objects. Which two options can the user see while adding Account team members to the Account?

- A. Contact Access
- **B. Case Access**
- C. Activity Access
- **D. Opportunity Access**

Answer: B,D

Explanation:

Explanation

Two options that the user can see while adding account team members to the account are case access and opportunity access. This is because these are the two objects that have public read only sharing settings and allow users to specify different levels of access for account team members. Contact access and activity access are not options because these objects have controlled by parent sharing settings and inherit their access from the account

NEW QUESTION # 46

Sales reps at Universal Containers sometimes create large files as a part of the sales process that are too large to share over email. They would like users to be able to share files with customers, but the CISO has requested that any file links shared must be password-protected. How can this be accomplished?

- A. Set up an Experience Cloud site for customers to access files and share the file with customers via Chatter. Customers can then log in to the site to access the content.
- **B. Create a content delivery; during creation, the user should select the option to require 3 password to access content.**
- C. Utilize an AppExchange product for delivering password protected files to customers

Answer: B

NEW QUESTION # 47

Universal Containers maintains Job information in a Custom Object that contains sensitive information. The only users who should be able to view and edit Job records are the user who owns the record and all users in the Delivery profile. Which three platform sharing tools are required to support the above requirements? Choose 3 answers.

- **A. Grant access Using Hierarchy sharing setting on the Job Object set to false.**
- B. "View All Data" profile permission on the Delivery Profile.
- **C. "Modify All" permission for Job Object on the Delivery Profile.**
- D. Criteria-Based sharing rule for the Delivery Profile on the Job Object.
- **E. Organization-Wide Default sharing setting of Private on the Job Object.**

Answer: A,C,E

Explanation:

Explanation

To support the requirement of allowing only the owner and users in the Delivery profile to view and edit Job records, you need to use three platform sharing tools:

Organization-Wide Default sharing setting of Private on the Job Object: This will restrict access to Job records to only the owner by default.

Grant access Using Hierarchy sharing setting on the Job Object set to false: This will prevent users above the owner in the role

hierarchy from accessing Job records.

"Modify All" permission for Job Object on the Delivery Profile: This will grant users in the Delivery profile full access to all Job records regardless of ownership.

Criteria-Based sharing rule and "View All Data" profile permission are not required for this scenario.

Criteria-Based sharing rule would grant additional access to users who meet certain criteria, which is not necessary. "View All Data" profile permission would grant access to all data in the organization, which is too broad and may violate data security.

NEW QUESTION # 48

Universal Containers (UC) uses a custom lightning component with an Apex class to display shipment information (custom object, private OWD). UC sales managers are complaining about two important points:

Shipment records that belong to their teams can be seen by other users.

Shipment amount should be visible only by managers, but sales reps are able to view it. Which two features did the development team miss that is causing the problems?

Choose 2 answers.

- A. Use isSharable keyword in Apex classes to assure record visibility.
- B. Use run as in test class to enforce user permissions and field-level permissions.
- C. Use isAccessible() method in Apex classes to check field accessibility
- D. Use with Sharing keyword in Apex classes to enforce sharing rules evaluation.

Answer: C,D

Explanation:

Explanation

The development team missed using the with Sharing keyword in Apex classes to enforce sharing rules evaluation, and the isAccessible() method in Apex classes to check field accessibility. The with Sharing keyword ensures that the Apex code respects the sharing rules defined for the current user, while the isAccessible() method checks if the user has read access to a specific field¹. The run as method in test class is used to test whether a user can perform certain actions, not to enforce permissions². The isSharable keyword in Apex classes does not exist.

NEW QUESTION # 49

The sales managers at Universal Containers requested their teams to define each user's role on their accounts in order to provide an easy way to establish accountability and collaboration. Sales managers also requested that sales associates should only get the following permissions: 1. Read access to the accounts. 2. Read access to cases related to the accounts. 3. No access to deals related to the accounts.

The sales associates may be granted access to opportunities when needed.

Assuming the overall sharing model of the organization is Private and no sharing rules are configured on the Account object, how should an architect achieve these requirements?

- A. Use Account teams and Case teams. No configuration required for the Opportunity object.
- B. Use Account teams and sharing rules to share cases with sales associates. No change required to the Opportunity object.
- C. Use Account teams to define access to accounts as well as opportunities and cases related to accounts.

Answer: C

Explanation:

* Account Teams: Enable fine-grained access control on accounts and related records (e.g., opportunities and cases). They allow defining the role of each user for collaboration and accountability.

* Sales Associate Permissions:

* Assign Read access to accounts.

* Assign Read access to cases using the account team role.

* No access to opportunities by default. Access can be granted on an as-needed basis via manual sharing or role-specific configuration.

* Why Option A is Correct: Account Teams provide a flexible and scalable way to configure access to related records based on the defined roles, fulfilling all requirements.

* Why Others Are Incorrect:

* Option B: Case Teams are unnecessary as the Account Team can handle case sharing.

* Option C: Sharing rules on cases add unnecessary complexity when Account Teams can directly manage case access.

For comprehensive guidance, refer to the Salesforce documentation on Account Teams: <https://help.salesforce>.
