Financial-Management Exam with Accurate WGU Financial Management VBC1 PDF Questions

Practice tests are also a core part of the Real4dumps product. We recognize that retention of information is crucial, and interactive learning tools, such as practice exams are provided to help students retain the information they have learned. These Financial-Management Practice Tests simulate the actual exam conditions and provide applicants with an accurate assessment of their readiness for the test.

WGU Financial Management VBC1 Sample Questions (Q27-Q32):

NEW QUESTION # 27

What is the relationship between the length of the cash cycle and the amount of cash a firm needs to operate?

- A. Shorter cash cycles require more cash to handle rapid transactions.
- B. A longer cash cycle reduces the need for operational cash due to increased efficiency.
- C. The cash cycle length has no impact on operational cash needs.
- **D. Companies must keep more cash on hand if they maintain a longer cash cycle.**

Answer: D

Explanation:

The cash conversion cycle measures the time between cash outflows for production and cash inflows from customer payments. A longer cash cycle means that cash is tied up for a longer period in inventory and receivables before being recovered through sales. As a result, firms with longer cash cycles require larger cash balances or greater access to short-term financing to support ongoing operations. Financial managers aim to shorten the cash cycle by improving inventory turnover, accelerating collections, and managing payables efficiently. Option D correctly reflects this fundamental relationship emphasized in working capital management.

NEW QUESTION # 28

Why might a firm use a combination of methods to calculate the cost of common equity?

- A. To account for one method being significantly more complex
- **B. To achieve a more accurate and comprehensive estimate**
- C. To comply with regulatory requirements
- D. To focus exclusively on dividend policies

Answer: B

Explanation:

No single model perfectly estimates the cost of common equity under all conditions. CAPM focuses on systematic risk, the Gordon growth model emphasizes dividends and growth, and other approaches may rely on market comparables. Each method has strengths and weaknesses depending on firm characteristics and market conditions. Financial management best practice therefore recommends using multiple approaches and comparing results to arrive at a more reliable estimate. This triangulation reduces model-specific bias and highlights potential inconsistencies in assumptions.

Managers then apply judgment to select a reasonable cost of equity that reflects risk, growth prospects, and investor expectations. Option A correctly reflects this practical, widely accepted approach.

NEW QUESTION # 29

To answer this question, refer to the cash flow worksheet and the internal rate of return (IRR) calculations.

The hospital is only interested in accepting projects with an IRR that exceeds 11%. Assuming the hospital has sufficient capital for both projects and is willing to invest for up to 10 years, which project(s) would the hospital accept?

- A. Neither Project A nor Project B
- B. Project B
- **C. Both Project A and Project B**
- D. Project A

Answer: C

Explanation:

The internal rate of return (IRR) represents the discount rate at which a project's net present value (NPV) equals zero. Financial management theory states that a project should be accepted if its IRR exceeds the firm's required rate of return (or hurdle rate), assuming conventional cash flows and no capital rationing.

In this scenario, the hospital has a minimum required return of 11% and sufficient capital to undertake all acceptable projects. Based on the provided IRR calculations, both Project A and Project B have IRRs exceeding 11%, making them financially acceptable under the IRR decision rule. Because there is no capital constraint and the investment horizon is sufficient, the hospital should accept both projects.

Financial management texts caution that IRR can sometimes produce misleading rankings when projects differ significantly in scale or timing. However, when evaluating independent projects with acceptable IRRs, the correct decision is to accept all projects that meet or exceed the required return. Option B correctly reflects this principle.

NEW QUESTION # 30

A company is expected to pay a dividend of \$2 next year, and dividends are expected to grow at 5% per year indefinitely. The required rate of return on the company's stock is 10%.

What is the value of the stock using the Gordon growth model?

- A. \$20
- B. \$15
- C. \$40
- D. \$61

Answer: C

Explanation:

The Gordon growth model values a stock assuming dividends grow at a constant rate indefinitely. The formula is:

$$\text{Stock Value} = D \div (r - g),$$

where D is the expected dividend next year, r is the required rate of return, and g is the growth rate.

Substituting the values:

$$\$2 \div (0.10 - 0.05) = \$2 \div 0.05 = \$40.$$

This model is widely used in valuation for mature companies with stable dividend growth. It highlights the sensitivity of stock value to growth expectations and required returns. Option C correctly applies the Gordon growth model formula.

NEW QUESTION # 31

How does the global bond market impact the strategies of multinational corporations?

- A. By ensuring fixed interest rates on all international loans
- B. By offering diverse financing options beyond domestic markets
- C. By enhancing incentives to raise capital domestically
- D. By reducing the need for currency risk management

Answer: B

Explanation:

Multinational corporations (MNCs) often seek the lowest-cost and most flexible sources of long-term financing. The global bond market expands their choices beyond domestic lenders and investors, enabling firms to issue debt in multiple countries, currencies, and structures (fixed vs. floating rates, maturities, secured vs. unsecured, and different covenant packages). This broad access can reduce the weighted average cost of capital (WACC) if foreign markets provide lower yields, deeper investor demand, or better terms for the issuer's credit profile. Global issuance can also support operational needs: an MNC earning revenues in euros or yen may issue bonds in those currencies to create a natural hedge, matching debt service with foreign-currency cash inflows and reducing exchange-rate exposure. However, the global bond market does not remove currency risk automatically (so B is incorrect), nor does it guarantee fixed interest rates (D is incorrect). While domestic issuance remains important, global markets increase strategic flexibility, allowing firms to optimize capital structure, diversify funding sources, manage refinancing risk, and tailor financing to geographic cash flows-core themes in international financial management.

NEW QUESTION # 32

.....

As is known to us, the quality is an essential standard for a lot of people consuming movements, and the high quality of the Financial-Management guide questions is always reflected in the efficiency. We are glad to tell you that the Financial-Management actual dumps from our company have a high quality and efficiency. If you decide to choose Financial-Management Actual Dumps as you
