CompTIA Security+ Certification Exam Sample Questions (Q559-Q564):

NEW QUESTION # 559
An organization needs to monitor its users' activities in order to prevent insider threats. Which of the following solutions would help the organization achieve this goal?

- A. Identity and access management
- B. Network intrusion detection system
- C. Behavioral analytics
- D. Access control lists

Answer: C

NEW QUESTION # 560
An administrator has identified and fingerprinted specific files that will generate an alert if an attempt is made to email these files outside of the organization. Which of the following best describes the tool the administrator is using?

- A. SCAP
- B. DLP
- C. IPS
- D. SNMP traps

Answer: B

Explanation:
The administrator is using a Data Loss Prevention (DLP) tool, which is designed to identify, monitor, and protect sensitive data. By fingerprinting specific files, DLP ensures that these files cannot be emailed or sent outside the organization without triggering an alert or blocking the action. This is a key feature of DLP systems, which prevent data exfiltration and ensure data security compliance.
* SNMP traps are used for network management and monitoring, not data protection.
* SCAP (Security Content Automation Protocol) is a set of standards for automating vulnerability management and policy compliance, unrelated to file monitoring.
* IPS (Intrusion Prevention System) blocks network-based attacks but does not handle file fingerprinting.

NEW QUESTION # 561
Which of the following is an example of memory injection?

- A. A process receives an unexpected amount of data, which causes malicious code to be executed.
- B. Malicious code is copied to the allocated space of an already running process.
- C. An executable is overwritten on the disk, and malicious code runs the next time it is executed.
- D. Two processes access the same variable, allowing one to cause a privilege escalation.

Answer: B

Explanation:
Memory injection occurs when malicious code is written into the memory space of a running process, allowing it to execute without writing anything to disk. This is often used in fileless malware attacks, making detection harder.
A (privilege escalation) describes a race condition, not memory injection.
B (unexpected data causing execution) describes a buffer overflow attack, not memory injection.
D (overwriting an executable) is a persistence technique, but it is not an example of in-memory injection.

NEW QUESTION # 562
Which of the following involves an attempt to take advantage of database misconfigurations?

- A. Buffer overflow
- B. SQL injection
- C. VM escape
- D. Memory injection

Answer: B

Explanation:
SQL injection is a type of attack that exploits a database misconfiguration or a flaw in the application code that interacts with the database. An attacker can inject malicious SQL statements into the user input fields or the URL parameters that are sent to the database server. These statements can then execute unauthorized commands, such as reading, modifying, deleting, or creating data, or even taking over the database server. SQL injection can compromise the confidentiality, integrity, and availability of the data and the system. Reference: CompTIA Security+ Study Guide: Exam SY0-701, 9th Edition, page 215 1

NEW QUESTION # 563

An attacker submits a request containing unexpected characters in an attempt to gain unauthorized access to information within the underlying systems. Which of the following best describes this attack?

- A. SQL injection
- B. Resource reuse
- C. Side loading
- D. Target of evaluation

Answer: A
