## Fortinet NSE 6 - FortiSOAR 7.3 Administrator Sample Questions (Q35-Q40):

### NEW QUESTION # 35

Which three roles are defined as SAML roles?  
(Choose three.)

- A. Attribute map
- B. Principal
- C. Identity provider
- D. Role
- E. Service provider

**Answer: B,C,E**

### NEW QUESTION # 36

Which two statements about FortiSOAR virtual instance deployment requirements are true? (Choose two.)

- A. There are size limits for the records database, but no charges or fees for storing months or years worth of data.
- B. FortiSOAR is supported on VMWare ESXi and Amazon Web Services (AWS).
- C. FortiSOAR Cloud is a subscription service that allows you to deploy an instance hosted on FortiCloud.
- D. While memory and storage can be added based on requirements, charges are required for every vCPU that is added to the FortiSOAR VM.

**Answer: B,C**

Explanation:

FortiSOAR offers flexibility in deployment environments, including FortiSOAR Cloud, which is a subscription service that enables hosting on FortiCloud. This provides cloud-hosted management with scalable resources. Additionally, FortiSOAR supports deployment on VMware ESXi and Amazon Web Services (AWS), allowing organizations to choose based on their infrastructure preferences. This flexibility ensures that FortiSOAR can be integrated into various IT environments depending on business needs.

### NEW QUESTION # 37

An administrator wants to collect and review all FortiSOAR log files to troubleshoot an issue. Which two methods can they use to accomplish this? (Choose two.)

- A. Enter the `caacta log -collect directory` command.
- B. Enter the `csacta services -status` command, and then copy the output.
- C. Download the logs from the GUI.
- D. Review the contents of `/var/log/messages`.

**Answer: A,C**

Explanation:

Administrators can collect and review FortiSOAR logs for troubleshooting in two primary ways. First, they can download logs directly from the GUI, which provides access to various logs through an intuitive interface. Secondly, using the command-line interface, the `csacta log --collect` command can be used to gather all logs within a specified directory, enabling more detailed offline analysis. Both methods offer comprehensive log collection to aid in diagnosing and resolving issues.

### NEW QUESTION # 38

Refer to the exhibit.

How long after the syops-ha service goes down will the heartbeat missed notification be sent to the administrator?

- A. 60 minutes
- B. 3 minutes
- C. 5 minutes
- D. 15 minutes

**Answer: A**

Explanation:

In FortiSOAR's high availability (HA) setup, if the cyops-ha service becomes unresponsive, the system is configured to send a "heartbeat missed" notification after a specified period, which in this case is 60 minutes.

This delay allows for transient issues to be resolved without triggering immediate alerts, while also ensuring that administrators are informed of prolonged service disruptions. Timely notifications about the cyops-ha service's status help maintain the reliability and responsiveness of the HA environment.

### NEW QUESTION # 39

Refer to the exhibit.

The former primary node was relegated to the secondary role but is stuck in the Faulted state.

Which two steps must you take to restore operation in the high availability (HA) cluster? (Choose two.)

- A. Restart the node that is in the Faulted state to trigger another election.
- B. Enter the `csadm ha join-cluster` command to have the node that is in the Faulted state rejoin the HA cluster as a secondary node.
- C. On the node that is in the Faulted state, enter the `csadm ha leave-cluster` command.
- D. Perform a fire drill to test the database integrity of the node that is in the Faulted state.

**Answer: B,C**

Explanation:

In a FortiSOAR HA cluster, if the former primary node is relegated to a secondary role but is stuck in a Faulted state, it indicates that the node has lost sync or faced a failure during a role change. To restore its functionality, first, you should remove it from the cluster using the `csadm ha leave-cluster` command. Once it has left the cluster, you can use the `csadm ha join-cluster` command to re-add the node as a secondary node.

This process will allow it to sync back up with the cluster and resume its role as intended.
