### Amazon AWS Certified Security - Specialty Sample Questions (Q97-Q102):

#### NEW QUESTION # 97

A company wants to remove all SSH keys permanently from a specific subset of its Amazon Linux 2 Amazon EC2 instances that are using the same IAM instance profile. However, three individuals who have IAM user accounts will need to access these instances by using an SSH session to perform critical duties. How can a security engineer provide the access to meet these requirements?

- A. Assign an IAM policy to the instance profile to allow the EC2 instances to be managed by AWS Systems Manager. Provide the IAM user accounts with permission to use Systems Manager. Remove the SSH keys from the EC2 instances. Use Systems Manager Inventory to select the EC2 instance and connect.
- B. Assign an IAM policy to the IAM user accounts to provide permission to use the EC2 service in the AWS Management Console. Remove the SSH keys from the EC2 instances. Connect to the EC2 instance as the ec2-user through the AWS Management Console's EC2 SSH client method.
- C. Assign an IAM policy to the instance profile to allow the EC2 instances to be managed by AWS Systems Manager. Provide the IAM user accounts with permission to use Systems Manager. Remove the SSH keys from the EC2 instances. Use Systems Manager Session Manager to select the EC2 instance and connect.
- D. Assign an IAM policy to the IAM user accounts to provide permission to use AWS Systems Manager Run Command. Remove the SSH keys from the EC2 instances. Use Run Command to open an SSH connection to the EC2 instance.

**Answer: C**

Explanation:

Explanation

To provide access to the three individuals who have IAM user accounts to access the Amazon Linux 2 Amazon EC2 instances that are using the same IAM instance profile, the most appropriate solution would be to assign an IAM policy to the instance profile to allow the EC2 instances to be managed by AWS Systems Manager, provide the IAM user accounts with permission to use Systems Manager, remove the SSH keys from the EC2 instances, and use Systems Manager Session Manager to select the EC2 instance and connect.

#### NEW QUESTION # 98

A company deployed an Amazon EC2 instance to a VPC on AWS. A recent alert indicates that the EC2 instance is receiving a suspicious number of requests over an open TCP port from an external source.

The TCP port remains open for long periods of time.

The company's security team needs to stop all activity to this port from the external source to ensure that the EC2 instance is not being compromised. The application must remain available to other users.

Which solution will meet these requirements?

- A. Create a new network ACL for the subnet. Deny all traffic from the EC2 instance to prevent data from being removed.

- B. Update the elastic network interface security group that is attached to the EC2 instance to remove the port from the inbound rule list.
- C. Update the elastic network interface security group that is attached to the EC2 instance by adding a Deny entry in the inbound list for the port and the source IP addresses.
- **D. Update the network ACL that is attached to the subnet that is associated with the EC2 instance. Add a Deny statement for the port and the source IP addresses.**

**Answer: D**

Explanation:

To address the issue of an Amazon EC2 instance receiving suspicious requests over an open TCP port, the most effective solution is to update the Network Access Control List (NACL) associated with the subnet where the EC2 instance resides. By adding a deny rule for the specific TCP port and source IP addresses involved in the suspicious activity, the security team can effectively block unwanted traffic at the subnet level. NACLs act as a stateless firewall for controlling traffic in and out of subnets, allowing for broad-based traffic filtering. This measure ensures that only legitimate traffic can reach the EC2 instance, thereby enhancing security without affecting the application's availability to other users. It's a more granular and immediate way to block specific traffic compared to modifying security group rules, which are stateful and apply at the instance level.

### NEW QUESTION # 99

A company hired an external consultant who needs to use a laptop to access the company's VPCs. Specifically, the consultant needs access to two VPCs that are peered together in the same AWS Region. The company wants to provide the consultant with access to these VPCs without also providing any unnecessary access to other network resources.

Which solution will meet these requirements?

Create an AWS Site-to-Site VPN endpoint in the same Region as the VPCs. Configure access through an appropriate subnet and authorization rule. Create an AWS account. Use the VPC sharing feature through AWS Resource Access Manager to allow the consultant to access the VPCs.

- A. Create an AWS Client VPN endpoint in the same Region as the B. VPCs. Configure access through an appropriate subnet and authorization rule.
- **B. Create a gateway VPC endpoint in the same Region as the VPCs. D. Configure access through an appropriate subnet and authorization rule.**

**Answer: B**

Explanation:

\* Set Up AWS Client VPN:

\* Deploy a Client VPN endpoint in the region where the VPCs are located.

\* Authorization Rule:

\* Configure the VPN endpoint with authorization rules to allow access only to the specific VPC subnets that the consultant needs.

\* VPC Peering Consideration:

\* Ensure routing between the peered VPCs is correctly configured to allow traffic from the Client VPN endpoint.

\* Advantages:

\* Secure Access: Provides encrypted access to the VPCs.

\* Granular Control: Restricts access to only required resources.

### NEW QUESTION # 100

A security engineer for a company wants to maintain all IAM users and roles according to the principle of least privilege. The security engineer plans to audit the IAM permissions once every 365 days. The security engineer must view the permissions that each IAM identity used in the last 365 days and must remove any unused permissions.

Which solution will meet these requirements?

- **A. Use AWS Identity and Access Management Access Analyzer to review last accessed information and to remove unused permissions.**
- B. Use AWS Config to review configuration changes by each IAM identity and to remove unused permissions.
- C. Use AWS Trusted Advisor to check the IAM identities that have elevated permissions and to remove unused permissions.
- D. Use AWS CloudTrail logs to review IAM identity actions and to remove unused permissions.

**Answer: A**

### NEW QUESTION # 101

A company's cloud operations team is responsible for building effective security for IAM cross-account access. The team asks a security engineer to help troubleshoot why some developers in the developer account (123456789012) in the developers group are not able to assume a cross-account role (ReadS3) into a production account (999999999999) to read the contents of an Amazon S3 bucket (productionapp). The two account policies are as follows:

Which recommendations should the security engineer make to resolve this issue? (Select TWO.)

- **A. Ask the developers to change their password and use a different web browser.**
- B. Modify the production account ReadS3 role policy to allow the PutBucketPolicy action on the productionapp S3 bucket.
- **C. Update the trust relationship policy on the production account S3 role to allow the account number of the developer account.**
- D. Ensure that developers are using multi-factor authentication (MFA) when they log in to their developer account as the developer role.
- E. Update the developer group permissions in the developer account to allow access to the productionapp S3 bucket.

**Answer: A,C**
