It is known to us that more and more companies start to pay high attention to the SAP-C02 certification of the candidates. Because these leaders of company have difficulty in having a deep understanding of these candidates, may it is the best and fast way for all leaders to choose the excellent workers for their company by the SAP-C02 Certification that the candidates have gained. More and more workers have to spend a lot of time on meeting the challenge of gaining the SAP-C02 certification by sitting for an exam.

The AWS Certified Solutions Architect - Professional (SAP-C02) certification exam consists of 75 multiple-choice and multiple-response questions and has a duration of 180 minutes. The passing score for the exam is 750 out of 1000. Candidates who pass the exam are awarded the AWS Certified Solutions Architect - Professional certification, which is valid for three years. AWS Certified Solutions Architect - Professional (SAP-C02) certification can be renewed by passing the current version of the exam or a higher-level certification exam.

Amazon SAP-C02 (AWS Certified Solutions Architect - Professional) Certification Exam is designed for IT professionals who are seeking to validate their skills and knowledge in designing and deploying highly available, cost-effective, fault-tolerant, and scalable systems on Amazon Web Services (AWS) cloud platform. It is an advanced-level exam that builds upon the foundational knowledge and skills tested in the AWS Certified Solutions Architect - Associate certification exam. The SAP-C02 Exam validates the candidate's ability to design, deploy, and manage complex AWS architectures and solutions that meet business requirements.

Therefore, you must prepare as per the changes of the Amazon SAP-C02 real test. For your assistance, Exam4Docs offers free real Amazon SAP-C02 dumps updates if Amazon Certification Exams changes the SAP-C02 examination content within 365 days of your purchase. These free SAP-C02 dumps updates will prevent you from mental stress, wasting time, and losing money.

Amazon AWS Certified Solutions Architect - Professional (SAP-C02) Sample Questions (Q406-Q411):

NEW QUESTION # 406

A company has five development teams that have each created five AWS accounts to develop and host applications. To track

spending, the development teams log in to each account every month, record the current cost from the AWS Billing and Cost Management console, and provide the information to the company's finance team.

The company has strict compliance requirements and needs to ensure that resources are created only in AWS Regions in the United States. However, some resources have been created in other Regions.

A solutions architect needs to implement a solution that gives the finance team the ability to track and consolidate expenditures for all the accounts. The solution also must ensure that the company can create resources only in Regions in the United States.

Which combination of steps will meet these requirements in the MOST operationally efficient way? (Select THREE.)

- A. Create a new account to serve as a management account. Deploy an organization in AWS Organizations with all features enabled. Invite all the existing accounts to the organization. Ensure that each account accepts the invitation.
- B. Create an OU that includes all the development teams. Create an SCP that allows the creation of resources only in Regions that are in the United States. Apply the SCP to the OU.
- C. Create an OU that includes all the development teams. Create an SCP that denies the creation of resources in Regions that are outside the United States. Apply the SCP to the OU.
- D. Create an IAM role in the management account. Attach a policy that includes permissions to view the Billing and Cost Management console. Allow the finance team users to assume the role. Use AWS Cost Explorer and the Billing and Cost Management console to analyze cost.
- E. Create an IAM role in each AWS account. Attach a policy that includes permissions to view the Billing and Cost Management console. Allow the finance team users to assume the role.
- F. Create a new account to serve as a management account. Create an Amazon S3 bucket for the finance team. Use AWS Cost and Usage Reports to create monthly reports and to store the data in the finance team's S3 bucket.

Answer: A,B,D

Explanation:

AWS Organizations is a service that enables you to consolidate multiple AWS accounts into an organization that you create and centrally manage. By creating a management account and inviting all the existing accounts to join the organization, the solutions architect can track and consolidate expenditures for all the accounts using AWS Cost Management tools such as AWS Cost Explorer and AWS Budgets. An organizational unit (OU) is a group of accounts within an organization that can be used to apply policies and simplify management. A service control policy (SCP) is a type of policy that you can use to manage permissions in your organization. By creating an OU that includes all the development teams and applying an SCP that allows the creation of resources only in Regions that are in the United States, the solutions architect can ensure that the company meets its compliance requirements and avoids unwanted charges from other Regions.

An IAM role is an identity with permission policies that determine what the identity can and cannot do in AWS. By creating an IAM role in the management account and allowing the finance team users to assume it, the solutions architect can give them access to view the Billing and Cost Management console without sharing credentials or creating additional users. NEW QUESTION # 407

A company has a legacy monolithic application that is critical to the company's business. The company hosts the application on an Amazon EC2 instance that runs Amazon Linux 2. The company's application team receives a directive from the legal department to back up the data from the instance's encrypted Amazon Elastic Block Store (Amazon EBS) volume to an Amazon S3 bucket. The application team does not have the administrative SSH key pair for the instance.

The application must continue to serve the users.

Which solution will meet these requirements?

- A. Create an image of the instance. Launch a new EC2 instance from the image. Attach a role to the new instance with permission to write to Amazon S3. Run a command to copy data into Amazon S3.
- B. Take a snapshot of the EBS volume by using Amazon Data Lifecycle Manager (Amazon DLM). Copy the data to Amazon S3.
- C. Attach a role to the instance with permission to write to Amazon S3. Use the AWS Systems Manager Session Manager option to gain access to the instance and run commands to copy data into Amazon S3.
- D. Create an image of the instance with the reboot option turned on. Launch a new EC2 instance from the image. Attach a role to the new instance with permission to write to Amazon S3. Run a command to copy data into Amazon S3.

Answer: C

Explanation:

AWS recommended to stop EC2 instances to create root volume snapshot.

When you create a snapshot for an EBS volume that serves as a root device, we recommend that you stop the instance before taking the snapshot.

<https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/ebs-creating-snapshot.html>

NEW QUESTION # 408

A large education company recently introduced Amazon Workspaces to provide access to internal applications across multiple universities. The company is storing user proxies on an Amazon FSx for Windows File Server file system. The file system is configured with a DNS alias and is connected to a self-managed Active Directory. As more users begin to use the Workspaces login time increases to unacceptable levels.

An investigation reveals a degradation in performance of the file system. The company created the file system on HDD storage with a throughput of 16 MBps. A solutions architect must improve the performance of the file system during a defined maintenance window.

What should the solutions architect do to meet these requirements with the LEAST administrative effort?

- A. Use AWS Backup to create a point-in-time backup of the file system. Restore the backup to a new FSx for Windows File Server file system. Select SSD as the storage type. Select 32 MBps as the throughput capacity. When the backup and restore process is completed, adjust the DNS alias accordingly. Delete the original file system.
- B. Deploy an AWS DataSync agent onto a new Amazon EC2 instance. Create a task. Configure the existing file system as the source location. Configure a new FSx for Windows File Server file system with SSD storage and 32 MBps of throughput as the target location. Schedule the task. When the task is completed, adjust the DNS alias accordingly. Delete the original file system.
- C. Enable shadow copies on the existing file system by using a Windows PowerShell command. Schedule the shadow copy job to create a point-in-time backup of the file system. Choose to restore previous versions. Create a new FSx for Windows File Server file system with SSD storage and 32 MBps of throughput. When the copy job is completed, adjust the DNS alias. Delete the original file system.
- D. Disconnect users from the file system. In the Amazon FSx console, update the throughput capacity to 32 MBps. Update the storage type to SSD. Reconnect users to the file system.

Answer: C

NEW QUESTION # 409

A solutions architect is designing an application to accept timesheet entries from employees on their mobile devices. Timesheets will be submitted weekly, with most of the submissions occurring on Friday. The data must be stored in a format that allows payroll administrators to run monthly reports. The infrastructure must be highly available and scale to match the rate of incoming data and reporting requests.

Which combination of steps meets these requirements while minimizing operational overhead?

(Choose two.)

- A. Store the timesheet submission data in Amazon Redshift. Use Amazon QuickSight to generate the reports using Amazon Redshift as the data source.
- B. Deploy the application in a container using Amazon Elastic Container Service (Amazon ECS) with load balancing across multiple Availability Zones. Use scheduled Service Auto Scaling to add capacity before the high volume of submissions on Fridays.
- C. Store the timesheet submission data in Amazon S3. Use Amazon Athena and Amazon QuickSight to generate the reports using Amazon S3 as the data source.
- D. Deploy the application to Amazon EC2 On-Demand Instances. With load balancing across multiple Availability Zones. Use scheduled Amazon EC2 Auto Scaling to add capacity before the high volume of submissions on Fridays.
- E. Deploy the application front end to an Amazon S3 bucket served by Amazon CloudFront. Deploy the application backend using Amazon API Gateway with an AWS Lambda proxy integration.

Answer: C,E

NEW QUESTION # 410

A company is developing a gene reporting device that will collect genomic information to assist researchers with collecting large samples of data from a diverse population. The device will push 8 KB of genomic data every second to a data platform that will

need to process and analyze the data and provide information back to researchers. The data platform must meet the following requirements:

- * Provide near-real-time analytics of the inbound genomic data
- * Ensure the data is flexible, parallel, and durable
- * Deliver results of processing to a data warehouse

Which strategy should a solutions architect use to meet these requirements?

- A. Use Amazon S3 to collect the inbound device data, analyze the data from Amazon SOS with Kinesis, and save the results to an Amazon Redshift cluster.
- B. Use an Amazon API Gateway to put requests into an Amazon SQS queue, analyze the data with an AWS Lambda function, and save the results to an Amazon Redshift cluster using Amazon EMR.
- C. Use Amazon Kinesis Data Firehose to collect the inbound sensor data, analyze the data with Kinesis clients, and save the results to an Amazon RDS instance.
- **D. Use Amazon Kinesis Data Streams to collect the inbound sensor data, analyze the data with Kinesis clients, and save the results to an Amazon Redshift cluster using Amazon EMR.**

Answer: D

Explanation:

Explanation

Kinesis Data Streams is a real-time streaming service and provide near-real-time analytics. Also the question

"Deliver results of processing to a data warehouse" and this option has redshift cluster which is a powerful data warehousing solution that can handle large-scale analytics workloads.
