Do you want to get the CLO-002 certification to boost your career? Do you desire to feel competent and confident going into your real CompTIA Cloud Essentials+ Certification Exam certification exam? Real CLO-002 Exam Questions are available right here at ExamsLabs, so don't waste your time going elsewhere. By practicing with our Real CLO-002 Exam Questions, which are offered in CLO-002 PDF, web-based practice test, and desktop practice exam software formats, you can crack your CompTIA Cloud Essentials+ Certification Exam (CLO-002) certification test on first attempt and advance in the CompTIA industry.

CompTIA CLO-002 exam is intended for IT professionals who are responsible for evaluating, implementing, and managing cloud computing solutions. This includes IT managers, system administrators, network administrators, and security administrators who need to understand the benefits and challenges of cloud computing. CLO-002 exam is also suitable for IT professionals who are new to the field of cloud computing and are looking to gain a foundational understanding of the technology. CompTIA Cloud Essentials+ Certification Exam certification is a valuable asset for IT professionals who are looking to advance their careers in cloud computing or who are looking to demonstrate their expertise to potential employers. Overall, the CompTIA CLO-002 Certification is a valuable credential for IT professionals who work in cloud computing environments and want to demonstrate their knowledge and skills in this rapidly growing field.

CompTIA Cloud Essentials+ Certification Exam Sample Questions (Q353-Q358):

NEW QUESTION # 353

A redundancy option must be provided for an on-premises server cluster. The financial team is concerned about the cost of extending to the cloud. Which of the following resources about the on-premises infrastructure would BEST help to estimate cloud costs?

- A. Resource management policy
- **B. Compute and storage reporting**
- C. Industry benchmarks
- D. Server cluster architecture diagram

Answer: B

Explanation:

Compute and storage reporting is the best resource to help estimate cloud costs for a redundancy option for an on-premises server cluster. Compute and storage reporting provides information about the current usage and performance of the on-premises servers, such as CPU, memory, disk, network, and I/O metrics. This information can help to determine the appropriate cloud service level and configuration that can match or exceed the on-premises capabilities.

Compute and storage reporting can also help to identify any underutilized or overprovisioned resources that can be optimized to reduce costs.

NEW QUESTION # 354

Which of the following BEST explains why there should be an established communication policy between CSPs and clients?

- A. To ensure all staff know the acceptable guidelines for representing themselves on social media.
- B. To set guidelines for securing network traffic for all communications with endpoints on the corporate local area network
- **C. To have protocols in place for notifying staff when a cloud outage occurs.**
- D. To have proper procedures in place for interactions between internal departments and cloud vendors submitting bids for software or service.

Answer: C

Explanation:

A communication policy between CSPs and clients is a set of rules and guidelines that define how, when, and what information is exchanged between the parties involved in a cloud service relationship. A communication policy can help ensure transparency, accountability, trust, and collaboration between CSPs and clients, as well as improve the quality and efficiency of the cloud service delivery and management. One of the main reasons why there should be an established communication policy between CSPs and clients is to have protocols in place for notifying staff when a cloud outage occurs. A cloud outage is a disruption or interruption of the availability or functionality of a cloud service, which can affect the performance, reliability, and security of the cloud service and its users. A cloud outage can be caused by various factors, such as hardware failures, software bugs, network issues, human errors, cyberattacks, or natural disasters. A communication policy can help define the roles and responsibilities of the CSPs and clients in the event of a cloud outage, such as who should report, monitor, escalate, resolve, and communicate the outage, and how they should do so. A communication policy can also help specify the communication channels, methods, formats, and frequencies that should be used to inform the relevant staff and stakeholders about the outage, such as email, phone, text, web portal, dashboard, or social media. A communication policy can also help establish the communication standards, expectations, and metrics that should be followed to ensure the accuracy, timeliness, and completeness of the outage information, such as the cause, impact, status, duration, and resolution of the outage. By having protocols in place for notifying staff when a cloud outage occurs, a communication policy can help minimize the negative effects of the outage, such as customer dissatisfaction, revenue loss, reputation damage, or legal liability. A communication policy can also help enhance the positive outcomes of the outage, such as customer loyalty, service improvement, incident learning, or risk mitigation. Therefore, option C is the best explanation of why there should be an established communication policy between CSPs and clients. Option A is incorrect because it does not explain why there should be a communication policy between CSPs and clients, but rather how to secure network traffic for all communications with endpoints on the corporate local area network. Network security is an important aspect of cloud service delivery and management, but it is not the same as communication policy. Option B is incorrect because it does not explain why there should be a communication policy between CSPs and clients, but rather how to ensure all staff know the acceptable guidelines for representing themselves on social media. Social media is one of the possible communication channels that can be used to exchange information between CSPs and clients, but it is

not the same as communication policy. Option D is incorrect because it does not explain why there should be a communication policy between CSPs and clients, but rather how to have proper procedures in place for interactions between internal departments and cloud vendors submitting bids for software or service. Cloud vendor selection is an important aspect of cloud service procurement and contracting, but it is not the same as communication policy. NEW QUESTION # 355

Which of the following is used to build and manage interconnections between cloud resources within the same cloud environment?

- A. Direct Connect
- B. Software-defined network
- C. Firewall
- D. Virtual private network

Answer: C

NEW QUESTION # 356

How can an organization successfully implement an IaaS strategy?

- A. Standardize on a limited set of virtual machines
- B. Continuously execute performance analytics
- C. Take inventory of the application portfolio and select external suppliers
- D. Open up internal databases with Web service access

Answer: A

NEW QUESTION # 357

Which of the following activities in a cloud environment requires a defined scope and formal authorization from the CSP?

- A. Vulnerability scanning
- B. Penetration testing
- C. Sandboxing
- D. Orchestration

Answer: B

Explanation:

Penetration testing, also known as ethical hacking, is a security assessment methodology that involves simulating a cyberattack on a cloud-based system or service to identify and exploit vulnerabilities and weaknesses. Penetration testing can help to evaluate the security posture of a cloud environment and provide recommendations for improvement¹² Penetration testing in a cloud environment requires a defined scope and formal authorization from the cloud service provider (CSP), because it can have significant impacts on the cloud infrastructure, applications, and data. Penetration testing can potentially cause damage, disruption, or breach of the cloud resources, as well as violate the terms of service or the service level agreements of the CSP. Therefore, before conducting penetration testing in a cloud environment, the customer must obtain the consent and approval of the CSP, and follow the guidelines and policies of the CSP regarding the scope, duration, frequency, and methods of the testing³ Orchestration, sandboxing, and vulnerability scanning are not activities that require a defined scope and formal authorization from the CSP, because they are less intrusive and disruptive than penetration testing. Orchestration is the process of automating and coordinating the deployment and management of cloud resources using tools and scripts. Sandboxing is the process of creating and isolating a testing environment within the cloud to experiment with new features or applications without affecting the production environment. Vulnerability scanning is the process of detecting and reporting the known vulnerabilities and misconfigurations in the cloud resources using automated tools. These activities can help to improve the efficiency, flexibility, and security of the cloud environment, but they do not involve actively exploiting or compromising the cloud resources. Therefore, they do not require the same level of permission and oversight from the CSP as penetration testing.
