InsuranceSuite-Analyst Exam Testking, Reliable InsuranceSuite-Analyst Dumps Files

Our InsuranceSuite-Analyst Exam Questions can help you pass the exam to prove your strength and increase social competitiveness. Although it is not an easy thing for somebody to pass the InsuranceSuite-Analyst exam, but our InsuranceSuite-Analyst exam torrent can help aggressive people to achieve their goals. This is the reason why we need to recognize the importance of getting the test Guidewire certification. More qualified certification for our future employment has the effect to be reckoned with, only to have enough qualification certifications to prove their ability, can we win over rivals in the social competition.

Guidewire Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam Sample Questions (Q60-Q65):

NEW QUESTION # 60

Why is it important for non-developers to have a basic understanding of the data model?

- A. It is necessary for analysts writing configuration scripts
- B. It helps them complete product configuration
- C. It helps them determine whether a field exists in the out-of-the-box product
- D. It helps them know the underlying data when documenting change requests

Answer: C,D

Explanation:

A basic understanding of the Guidewire data model is essential for non-developers, especially Business Analysts, to effectively document requirements and evaluate change requests. The correct answers are Options B and C.

Understanding the data model helps analysts determine whether a field already exists in the out-of-the-box product (Option B). This knowledge prevents unnecessary customization and supports Guidewire's configure-over-customize principle.

It also enables analysts to understand the underlying data structure when documenting change requests (Option C). Analysts who understand entities, relationships, and field types can write clearer requirements and anticipate downstream impacts.

Non-developers are not responsible for writing configuration scripts or completing product configuration, making Options A and D incorrect.

NEW QUESTION # 61

How are Page Configuration Format (PCF) files used in the Guidewire development environment?

- A. Developers work with them using the Guidewire Studio tool.
- B. Non-developers use PCF files to perform data analysis and reporting tasks.
- C. They serve as automated testing scripts for validating UI functionality.
- D. They contain the schema definition for the application database.
- E. Business analysts configure them to define requirements.
- F. Developers use them to create and edit the visual components of the user interface.

Answer: A,F

Explanation:

In Guidewire Insurance Suite, Page Configuration Format (PCF) files are a core part of the user interface configuration layer. They define the structure, layout, and behavior of screens, panels, lists, and UI components displayed to end users. Therefore, Options B and F are correct.

PCF files are used by developers to create and edit the visual components of the UI (Option B). These files control how data is presented, how users navigate between screens, and how UI elements respond to user interaction. PCF files reference entities, fields, type lists, and rules, but they do not define business logic themselves.

Developers work with PCF files using Guidewire Studio (Option F), which is the primary IDE for configuring Guidewire applications. Studio provides validation, navigation, and deployment tooling for PCF files, making it the correct environment for managing UI configuration.

The other options are incorrect. Database schema definitions are handled by the data model, not PCF files (Option A). Non-developers do not use PCF files for reporting (Option C). Business analysts document requirements but do not configure PCF files directly (Option D). PCF files are not automated test scripts (Option E).

For analysts, understanding what PCF files do and who works with them helps ensure requirements are written clearly and realistically, aligned with Guidewire UI architecture.

NEW QUESTION # 62

A new Business Analyst on a Marine Cargo claims project is learning about the Guidewire UI. They want to ensure consistent communication between the various roles on the project when documenting new features within the common UI architecture. Which of the following represents one of the five common areas of the Guidewire UI architecture?

- A. Widgets, such as buttons and text inputs, which comprise the interactive elements of a screen.
- B. The Screen which is the primary display for most business information.
- C. The Info Bar, offering concise summary details relevant to the main screen.
- D. The QuickJump Box, a search utility found in the Tab Bar.
- E. User stories, which define the high-level requirements from a user's perspective.
- F. Page Configuration Format (PCF) files, used by developers to build screens.

Answer: B

Explanation:

The correct answer is E. The Screen which is the primary display for most business information .

In Guidewire InsuranceSuite, the UI is discussed using a set of common architectural areas so that analysts, developers, testers, and business users can communicate consistently about what they are seeing and documenting. Among the options listed, Screen is the best match for one of those recognized UI areas because it refers to the main portion of the application where users view and interact with core business data.

A screen is the central working area where most transaction details, policy information, claim details, underwriting content, or account data are displayed. For a Business Analyst, understanding this term is important because requirements often describe what a user needs to see, enter, review, or update on a screen.

Using the correct UI terminology improves precision in story writing, workshop discussions, defect reporting, and collaboration with configuration teams.

The other options are not the best answer in this context. PCF files are technical implementation artifacts, not UI areas from a business communication perspective. User stories are requirements artifacts, not parts of the UI. QuickJump Box is a feature within a larger UI region rather than one of the main common areas. Widgets are lower-level screen elements such as fields and buttons, again not one of the broader common UI areas.

Info Bar is a UI element, but the most clearly recognized and broadly applicable common area among the choices is the Screen .

NEW QUESTION # 63

A Guidewire Cloud project needs to implement functionality that tracks certification status held by contractors performing work on a claim. The status will be selected from a predefined list, and the user will also need to capture free-text notes about the certification. Applying your understanding of the Guidewire Data Model, which two changes to the base data model structure are MOST likely needed to support these requirements?

- A. Add a new entity specifically for Contractor Certifications
- B. Create a .TTX file for the specific certification types
- C. Add new fields (for example, text or typekey)
- D. Create a Typelist to define the specific certification types
- E. Add two new labels (for example, text or typekey)
- F. Update the relevant PCF file for the screen

Answer: C,D

Explanation:

When extending the Guidewire data model, analysts must distinguish between data structure changes and UI or presentation changes. In this scenario, the business requirement is to store a certification status selected from a predefined list and free-text notes related to that certification.

The correct data model changes are to create a Typelist and add new fields, making Options D and E correct.

A Typelist (Option D) is the standard Guidewire mechanism for representing a predefined set of selectable values, such as certification statuses (for example, Certified, Expired, Pending). Typelists ensure data consistency, support localization, and integrate cleanly with rules, validations, and UI components.

In addition, new fields must be added to the data model (Option E). One field would typically be a typekey referencing the typelist for certification status, and another would be a text field to store the free-text certification notes. These fields would be added to an appropriate existing entity (such as a contractor-related or claim-related entity), depending on the design.

The other options are not data model changes. Updating PCF files (Option A) affects the UI, not how data is stored. Creating a new entity (Option B) is unnecessary unless there is a complex, repeatable certification structure. A .ttx file (Option C) is not used for typelist definition. Labels (Option F) control display text, not data storage.

NEW QUESTION # 64

Please select User Story Card best practices from the list below. (Choose two)

- A. Review every requirement with the team
- B. Include field requirements in the UI Mock-up tab
- C. Include a requirement number for traceability
- D. Change a requirement number after the story card has been published

Answer: A,C

Explanation:

Guidewire SurePath emphasizes consistency, clarity, and traceability when documenting User Story Cards.

Two key best practices that support these principles are including requirement numbers for traceability and reviewing every requirement with the team, making Options C and D correct.

Including a requirement number (Option C) is a critical best practice because it enables end-to-end traceability. Requirement numbers allow analysts to link business requirements to user stories, acceptance criteria, test cases, defects, and final delivery. This is especially important in regulated insurance environments and large Guidewire programs where scope control and auditability are essential.

Reviewing every requirement with the team (Option D) ensures shared understanding across Business Analysts, Developers, and Quality Analysts. These reviews help identify gaps, assumptions, and ambiguities early, reducing rework and defects later in the project. This collaborative approach aligns with Agile and Guidewire's emphasis on early validation.

The remaining options are not best practices. Field-level requirements should be documented in requirement or rules sections, not embedded in UI mockup tabs (Option A). Changing requirement numbers after publication (Option B) breaks traceability and creates confusion across dependent artifacts.

NEW QUESTION # 65

.....

Our Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam exam questions are designed by a reliable and reputable company and our company has rich experience in doing research about the study materials. We can make sure that all employees in our company have wide experience and advanced technologies in designing the InsuranceSuite-Analyst study dump. So a growing number of the people have used our study materials in the past years, and it has been a generally acknowledged fact that the quality of the InsuranceSuite-Analyst Test Guide from our company is best in the study materials market. Now we would like to share the advantages of our InsuranceSuite-Analyst study dump to you, we hope you can spend several minutes on reading our introduction; you will benefit a lot from it.
