Itexamdump의 SailPoint IdentityIQ-Engineer덤프를 구매하기전 우선 pdf버전 덤프샘플을 다운받아 덤프문제를 공부해 보시면Itexamdump덤프품질에 신뢰가 느껴질것입니다. Itexamdump의 SailPoint IdentityIQ-Engineer덤프가 고객님의 시험패스테 조금이나마 도움이 되신다면 행복으로 느끼겠습니다.

SailPoint IdentityIQ-Engineer 시험요강:

주제	소개
주제 1	• Installation and Configuration: Detailed knowledge of how to install and configure IdentityIQ, including setup, database configurations, and integration with other systems.
주제 2	• Troubleshooting and Best Practices: Diagnosing and addressing common issues, adhering to best practices for deployment, and optimizing performance.
주제 3	• Customization and Development: Tailoring IdentityIQ workflows, rules, and interfaces to align with specific business requirements, which includes utilizing SailPoint APIs and employing BeanShell for bespoke development.
주제 4	• Identity Governance and Administration: Implementation of identity governance processes, including access certifications, policy enforcement, and identity lifecycle management.
주제 5	• IdentityIQ Fundamentals: This section covers understanding the core architecture, components, and functionalities of IdentityIQ, including the role of identity governance.
주제 6	• Reporting and Analytics: Developing and administering reports within IdentityIQ to aid in compliance and audit processes, as well as comprehending the platform's analytics features.

IT인증자격증을 취득하는 것은 IT업계에서 자신의 경쟁력을 높이는 유력한 수단입니다. 경쟁에서 밀리지 않으려면 자격증을 많이 취득하는 편이 안전합니다. 하지만 IT자격증취득은 생각보다 많이 어려운 일입니다. SailPoint인증 IdentityIQ-Engineer시험은 인기자격증을 취득하는데 필요한 시험과목입니다. Itexamdump는 여러분이 자격증을 취득하는 길에서의 없어서는 안될 동반자입니다. Itexamdump의SailPoint인증 IdentityIQ-Engineer덤프로 자격증을 편하게 취득하는게 어떨까요?

최신 Identity Security Engineer IdentityIQ-Engineer 무료샘플문제 (Q106-Q111):

질문 # 106

Is this a default functionality of the Lifecycle Manager (LCM) module?

Proposed Solution:

Launch Certification Campaign

- A. No
- B. Yes

정답: A

설명:

No. Launching certification campaigns is not default Lifecycle Manager functionality. Lifecycle Manager focuses on identity lifecycle and access-request operations such as joiner, mover, leaver processing, access requests, account management, approvals, and provisioning workflows. Certification campaigns belong to IdentityIQ's access review and compliance/certification capabilities, not LCM's default functional scope.

Certifications are used to review access, roles, entitlements, policy violations, or account/group membership and then require reviewers to approve, revoke, or otherwise act on access. LCM may interact with certification results indirectly because remediation from a certification can trigger provisioning or access changes, but launching the campaign itself is a certification/compliance function. This question tests whether the engineer separates lifecycle-request processing from access-review governance. Mixing them up leads to poor module design and incorrect implementation expectations. References/topics: IdentityIQ Engineer - Lifecycle Manager, access request, provisioning workflows, certification campaigns, Compliance Manager.

질문 # 107

Is the following statement about IdentityIQ rule inputs and outputs correct?

Solution: The typical input variables for a rule are listed in the BeanShell rule editor in IdentityIQ, based on the rule registry.

- A. Yes
- B. No

정답: A

설명:

Yes, the typical input variables for a rule are listed in the BeanShell rule editor in IdentityIQ, based on the rule registry. When you create or edit a rule in IdentityIQ using the BeanShell editor, the available input variables that are relevant to the rule type are typically pre-defined and listed based on the rule registry. These input variables provide context and data that the rule can operate on, and their availability helps guide the rule development process.

Therefore, the correct answer is A. Yes.

Reference:

This information is confirmed by the SailPoint IdentityIQ Developer Guide, which discusses how the rule editor provides input variables based on the rule type and registry, ensuring that developers have the necessary context for writing rules.

질문 # 108

Is this statement true about identityIQ 's syslog event storage?

Solution: Both logging and auditing can have a negative influence on performance. Logging and auditing both require extra function calls within The application and will generate data that will need to be stored.

- A. Yes

- B. No

정답: A

설명:

Yes, the statement is true. Both logging and auditing in SailPoint IdentityIQ can have a negative influence on performance because they involve additional function calls within the application. These processes generate data that needs to be stored, which can impact performance if not managed properly. Extensive logging and auditing, particularly at high levels of detail, can lead to increased I/O and storage usage, potentially slowing down system operations.

질문 # 109

is the following a valid role option that can be configured?

Solution: Configure a role to include a set of IdentityIQ capabilities.

- A. Yes
- B. No

정답: A

설명:

The statement is true. In SailPoint IdentityIQ, it is possible to configure a role to include a set of IdentityIQ capabilities. Capabilities in IdentityIQ are permissions that grant users access to specific functionalities within the platform, such as managing identities, viewing reports, or administering roles. By associating a role with specific capabilities, you can control what actions users assigned to that role can perform within the IdentityIQ environment.

질문 # 110

Can the search type in Syslog be used to accomplish this result?

Solution: Identifying the number of employees that report to a specific person

- A. No
- B. Yes

정답: A

설명:

Syslog is primarily used for logging system events and not for performing complex searches or queries on hierarchical or organizational data like identifying the number of employees that report to a specific person. Such a query would typically require access to the organizational hierarchy or identity data, which is better achieved through IdentityIQ's reporting or search capabilities within the application rather than using Syslog. Syslog captures log events related to system operations, errors, and other activity logs but isn't designed for the type of structured query described in the question.
