NEW QUESTION # 50

You have implemented a wireless mesh network. All mesh nodes are properly configured for participation in the same mesh network. Several of the mesh nodes are unable to connect to other mesh nodes. What action may provide a solution to this problem?

- A. Move the faulty mesh nodes to provide for better signal strength
- B. Place the faulty mesh nodes in their own mesh network
- C. Change the output power settings only on the faulty mesh nodes
- D. Change the security settings on the faulty mesh nodes

Answer: A

Explanation:

* Mesh Connectivity Depends on Signal: Mesh nodes relay data for each other. Weak signal strength between nodes can disrupt connectivity throughout the network.

* Troubleshooting Signal Issues: Physically relocating affected nodes can improve their ability to form stable connections with other nodes in the mesh.

* Why Other Options May Not Help:

* Separate Mesh: Splits the network, not solving the root connectivity issue

* Output Power: May help marginally, but significant improvement is typically achieved through repositioning.

* Security Settings: Unlikely to cause connectivity issues between properly configured nodes in the same mesh.
