The CrowdStrike Certified Cloud Specialist (CCCS-203b) certification is a valuable credential that every CrowdStrike professional should earn it. The CrowdStrike CCCS-203b certification exam offers a great opportunity for beginners and experienced professionals to demonstrate their expertise. With the CrowdStrike Certified Cloud Specialist (CCCS-203b) certification exam everyone can upgrade their skills and knowledge. There are other several benefits that the CCCS-203b Exam holders can achieve after the success of the CrowdStrike Certified Cloud Specialist (CCCS-203b) certification exam. However, you should keep in mind to pass the CrowdStrike CCCS-203b certification exam is not an easy task. It is a challenging job.

We are equipped with a team of IT elites who have a good knowledge of IT field and do lots of study in CrowdStrike certification exam. All dumps free of Prep4SureReview are creating based on the actual test. Our colleagues check the updating of CCCS-203b Test Questions everyday to make sure that all answers are latest and valid. Our CCCS-203b test study material contains valid top questions and detailed exam answers.

CCCS-203b Latest Dumps Free - CCCS-203b Latest Exam Tips

For candidates who are going to buy the exam dumps for the exam, the quality must be one of the most standards while choosing the exam dumps. CCCS-203b exam dumps are high quality and accuracy, since we have a professional team to research the first-rate information for the exam. We have reliable channel to ensure that CCCS-203b Exam Materials you receive is the latest one. We offer you free update for one year, and the update version for CCCS-203b exam materials will be sent to your automatically. We have online and offline service, and if you have any questions for CCCS-203b exam dumps, you can consult us.

CrowdStrike Certified Cloud Specialist Sample Questions (Q236-Q241):

NEW QUESTION # 236

A security team using CrowdStrike Falcon Runtime Protection wants to detect and respond to Indicators of Attack (IOAs) in their containerized environment. Which of the following is the best approach for detecting IOAs in real-time?

- A. Only analyze static container images for known vulnerabilities before deployment.
- B. Rely exclusively on Kubernetes audit logs to identify threats within the environment.
- C. Block all incoming network connections to containerized workloads to prevent potential attacks.
- D. Monitor system calls and process behaviors in runtime to detect anomalous activity indicative of an attack.

Answer: D

Explanation:

Option A: CrowdStrike Falcon Runtime Protection detects Indicators of Attack (IOAs) by monitoring system calls, process behaviors, and runtime activities in containers. This allows Falcon to identify anomalous activity, privilege escalation attempts, and

suspicious behaviors indicative of an attack.

Option B: Blocking all network traffic would break legitimate communications and is not a practical security measure. Instead, Falcon applies behavioral analytics to detect suspicious network activity dynamically.

Option C: Static analysis alone is insufficient for detecting IOAs, as runtime threats may emerge after deployment, including zero-day attacks and living-off-the-land techniques.

Option D: While Kubernetes audit logs provide useful insights, they do not capture all IOAs, particularly those at the process and system call level within containers.

NEW QUESTION # 237

What is required to ensure you can retrieve the Falcon KAC image when deploying the Falcon Kubernetes Admission Controller (KAC) with a Helm chart?

- A. API client key
- B. Docker
- C. SENSOR_PLATFORM
- D. FALCON_REGION

Answer: A

Explanation:

When deploying the Falcon Kubernetes Admission Controller (KAC) using a Helm chart, access to CrowdStrike-hosted container images is required. These images are stored in CrowdStrike's private container registry, which requires authentication.

To retrieve the Falcon KAC image, a valid CrowdStrike API client key (client ID and secret) must be provided. This API credential allows Helm to authenticate to the Falcon registry and securely pull the required KAC image during deployment. Without valid API credentials, image retrieval fails, and the KAC deployment cannot complete successfully.

Other options listed do not satisfy this requirement. SENSOR_PLATFORM and FALCON_REGION are configuration parameters used during sensor installation but do not authenticate registry access. Docker itself is not sufficient, as authentication to the CrowdStrike registry is still required.

Therefore, an API client key is mandatory to ensure successful retrieval of the Falcon KAC image during Helm-based deployment.

NEW QUESTION # 238

A containerized workload that spawns a background shell process outside of its original image configuration is considered a _____ event.

- A. kill-chain
- B. validation
- C. benchmark
- D. drift

Answer: D

NEW QUESTION # 239

Which of the following is a critical requirement for registering a Google Cloud account with CrowdStrike Falcon?

- A. Providing direct SSH access to all virtual machines in the account.
- B. Enabling network-level access for Falcon agents on all virtual machines.
- C. Assigning full administrative access to the Falcon integration user.
- D. Configuring a service account with specific permissions for monitoring.

Answer: D

Explanation:

Option A: Full administrative access is not required. CrowdStrike uses least-privilege principles to secure integration without exposing the account to unnecessary risks.

Option B: Registering a Google Cloud account with CrowdStrike Falcon requires configuring a service account with the necessary permissions for monitoring. These permissions include access to APIs and logs essential for security posture assessment. Using a service account ensures secure and scalable integration.

Option C: Falcon's cloud account registration does not involve network-level access for agents.

Monitoring is achieved through API integration, not direct VM-level control.

Option D: SSH access to VMs is not required for Google Cloud account integration, as Falcon leverages cloud-native APIs for monitoring.

NEW QUESTION # 240

A security administrator needs to edit an existing Falcon Sensor policy to reduce the potential for false positives. What action is required to achieve this?

- A. Move the policy to the bottom of the policy priority list in the Falcon Console.
- **B. Lower the sensitivity of "Exploit Detection" to avoid triggering false alerts.**
- C. Delete the existing policy and recreate it with the updated configuration.
- D. Add an exclusion rule for all system processes to prevent unnecessary alerts.

Answer: B

Explanation:

Option A: Excluding all system processes creates a significant security risk and is not an effective way to manage false positives.

Option B: Editing the existing policy is sufficient and does not require deletion. Recreating policies unnecessarily increases administrative overhead.

Option C: Lowering the sensitivity of "Exploit Detection" can help reduce false positives by adjusting the thresholds for detecting potential threats. This action retains proactive protection while improving alert accuracy.

Option D: Policy priority affects which policy is applied when multiple policies overlap but does not address false positives within a policy.

NEW QUESTION # 241

.....

High quality and high accuracy CCCS-203b real materials like ours can give you confidence and reliable backup to get the certificate smoothly because our experts have extracted the most frequent-tested points for your reference, because they are proficient in this exam who are dedicated in this area over ten years. Besides, from economic perspective, our CCCS-203b study dumps are priced reasonably so we made a balance between delivering satisfaction to customers and doing our own jobs. So in this critical moment, our CCCS-203b real materials will make you satisfied. Our CCCS-203b exam materials can provide integrated functions. You can learn a great deal of knowledge and get the certificate of the exam at one order like win-win outcome at one try.
