### Fortinet EMEA Advanced Support Exam Sample Questions (Q50-Q55):

#### NEW QUESTION # 50

How does a stateful firewall control a TCP session?

- A. TCP destination ports are used to control the session
- B. TCP ack numbers are used to control the session
- C. TCP source ports are used to control the session
- D. **TCP sequence numbers and TCP flags are used to control the session**

#### Answer: D

Explanation:

A stateful firewall, like FortiGate, tracks TCP sessions by maintaining a state table that includes TCP sequence numbers and flags (e.g., SYN, ACK, FIN) to monitor the connection's lifecycle (establishment, data transfer, termination). This ensures proper session handling, detecting out-of-order packets or invalid states.

Source and destination ports identify the session but don't control its state, and ACK numbers alone are insufficient. Exact extract: "Stateful inspection tracks TCP sessions using sequence numbers and TCP flags (SYN, ACK, FIN, etc.) to ensure packets are valid and part of an established session... FortiGate maintains a state table to monitor the TCP connection states."

#### NEW QUESTION # 51

What is the role of the FortiGate 'set srcintf' command in a firewall policy?

- A. **Specifies the source interface for traffic matching**
- B. Defines the destination interface for traffic
- C. Sets the source IP address range
- D. Configures the source NAT interface

#### Answer: A

Explanation:

The 'set srcintf' command in a FortiGate firewall policy specifies the source interface from which traffic originates, helping define the policy's scope. It does not set the destination interface (B), source IP range (C), or NAT interface (D). Exact extract: "The 'set srcintf' command in a firewall policy specifies the source interface for incoming traffic, allowing FortiGate to match packets based on their entry interface."

#### NEW QUESTION # 52

Which parts of the IKE protocol below are responsible for authenticating the User (username/password) of a dialup IPsec tunnel?  
(Check all correct answers)

- A. **IKEv1 Xauth**
- B. IKEv2 SA\_INIT
- C. IKEv1 phase2
- D. IKEv1 phase1
- E. **IKEv2 EAP**

#### Answer: A,E

Explanation:

For user authentication in dialup IPsec, IKEv1 uses XAuth (Extended Authentication) after Phase 1 for username/password. IKEv2 uses EAP (Extensible Authentication Protocol) for similar user auth. Phase 1 and SA\_INIT are for peer auth, Phase 2 for child SA negotiation. Exact extract: XAuth increases security by requiring remote dialup client users to authenticate in a separate exchange at the end of phase 1. IPsec IKEv2 VPNs now support certificate authentication and EAP authentication at the same time from a dialup FortiClient. With the eap-cert-auth setting ... IPsec IKEv2 VPNs now support certificate authentication and EAP authentication at the same time from a dialup FortiClient. IPsec IKEv1 uses XAUTH for user authentication, and IPsec IKEv2 uses EAP for user authentication. Only EAP-TTLS is interoperable with LDAP. For LDAP based user ... In your scenario, the user cannot authenticate by providing both a PSK and their credentials (using one of multiple EAP methods).

### NEW QUESTION # 53

Which of the following is a benefit of using FortiGate's Security Fabric?

- A. It increases the speed of IPsec VPN tunnels
- B. It automatically configures VLANs on FortiSwitches
- **C. It enables centralized management of multiple Fortinet devices**
- D. It reduces the need for firewall policies

**Answer: C**

Explanation:

The Fortinet Security Fabric provides a centralized management platform for multiple Fortinet devices (e.g., FortiGate, FortiSwitch, FortiAP), enabling coordinated security policies, telemetry sharing, and simplified administration. It does not directly speed up VPNs (B), reduce firewall policies (C), or auto-configure VLANs (D). Exact extract: 'The Fortinet Security Fabric enables centralized management and visibility across Fortinet devices, allowing coordinated security policies and telemetry sharing for enhanced protection.'

### NEW QUESTION # 54

What tool would you use to verify a certificate?

- A. Certtester
- **B. OpenSSL**
- C. Nessus
- D. Hping

**Answer: B**

Explanation:

OpenSSL is a widely used command-line tool for verifying certificates, checking validity, chains, and details like subject, issuer, and expiration. It is supported in Fortinet troubleshooting and certificate management.

Nessus is for vulnerability scanning, Hping for packet crafting, Certtester is not standard. Exact extract:

Description. This article describes how to verify by OpenSSL if the format of the certificate is correct when getting an error message like ... How to verifying the Certificate by CA Certificate on openssl command. You can verify the certificate's validity by CA certificate. Example 1: ... Navigate to System -> Certificate -> Create/Import. Select Import Certificate -> Select Type Certificate. Upload server.pem. Upload ca.key.

Description, This article describes how to sign and generate certificates using OpenSSL in Windows OS that can be used for SSL VPN and IPsec VPN ... This section discusses the following tasks you can perform on the System > Certificate > Manage Certificates page.
