Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q182-Q187):

NEW QUESTION # 182

A Developer has created a software package to be deployed on multiple EC2 instances using IAM roles. What actions could be performed to verify IAM access to get records from Amazon Kinesis Streams? (Select TWO.)

- A. Query Amazon EC2 metadata for in-line IAM policies.
- **B. Validate the IAM role policy with the IAM policy simulator.**
- C. Request a token from AWS STS, and perform a describe action.
- **D. Perform a get action using the --dry-run argument.**
- E. Use the AWS CLI to retrieve the IAM group.

Answer: B,D

Explanation:

Explanation

Refer AWS documentation - EC2 API & IAM Testing Policies

DryRun

Checks whether you have the required permissions for the action, without actually making the request. If you have the required permissions, the request returns ; otherwise, it returns UnauthorizedOperation.

With the IAM policy simulator, you can test and troubleshoot IAM and resource-based policies in the following ways:

* Test policies that are attached to IAM users, groups, or roles in your AWS account. If more than one policy is attached to the user, group, or role, you can test all the policies, or select individual policies to test. You can test which actions are allowed or denied by the selected policies for specific resources.

* Test policies that are attached to AWS resources, such as Amazon S3 buckets, Amazon SQS queues, Amazon SNS topics, or Amazon Glacier vaults.

* If your AWS account is a member of an AWS Organization, then you can test the impact of organization control policies on your IAM policies and resource policies.

* Test new policies that are not yet attached to a user, group, or role by typing or copying them into the simulator. These are used only in the simulation and are not saved. Note: you cannot type or copy a resource-based policy into the simulator. To use a resource-based policy in the simulator, you must include the resource in the simulation and select the check box to include that resource's policy in the simulation.

* Test the policies with selected services, actions, and resources. For example, you can test to ensure that your policy allows an entity to perform the ListAllMyBuckets, CreateBucket, and DeleteBucket actions in the Amazon S3 service on a specific bucket.

* Simulate real-world scenarios by providing context keys, such as an IP address or date, that are included in Condition elements in the policies being tested.

* Identify which specific statement in a policy results in allowing or denying access to a particular resource or action.

NEW QUESTION # 183

A gaming application stores scores for players in an Amazon DynamoDB table that has four attributes user_id, user_name, user_score, and user_rank. The users are allowed to update their names only A user is authenticated by web identity federation. Answer: C

NEW QUESTION # 184

An AWS Lambda function must read data from an Amazon RDS MySQL database in a VPC and also reach a public endpoint over the internet to get additional data.

Which steps must be taken to allow the function to access both the RDS resource and the public endpoint? (Select TWO.)

- A. Modify the default network access control list to allow outbound traffic.
- B. Add a NAT Gateway to the VPC.
- C. Add an environmental variable to the Lambda function to allow outbound internet access.
- D. Modify the default configuration for the Lambda function to associate it with an Amazon VPC private subnet.
- E. Modify the default configuration of the Lambda function to associate it with a VPC public subnet.

Answer: B,D

NEW QUESTION # 185

A Developer is writing an imaging micro service on AWS Lambda. The service is dependent on several libraries that are not available in the Lambda runtime environment.

Which strategy should the Developer follow to create the Lambda deployment package?

- A. Create a ZIP file with the source code and all dependent libraries.
- B. Create a ZIP file with the source code. Stage the dependent libraries on an Amazon S3 bucket indicated by the Lambda environment variable LD_LIBRARY_PATH
- C. Create a ZIP file with the source code and a script that installs the dependent libraries at runtime.
- D. Create a ZIP file with the source code and a buildspec.yaml file that installs the dependent libraries on AWS Lambda.

Answer: C

NEW QUESTION # 186

A healthcare company is developing a multi-tier web application to manage patient records that are in an Amazon Aurora PostgreSQL database cluster. The company stores the application code in a Git repository and deploys the code to Amazon EC2 instances.

The application must comply with security policies and follow the principle of least privilege. The company must securely manage database credentials and API keys within the application code. The company must have the ability to rotate encryption keys on demand.

Which solution will meet these requirements?

- A. Store the database credentials and API keys as parameters in AWS Systems Manager Parameter Store. Encrypt the credentials and API keys with AWS managed AWS KMS keys. Use the AWS SDK to retrieve secrets.
- B. Store the database credentials and API keys in AWS Secrets Manager. Use customer managed AWS KMS keys. Set up automatic key rotation. Create a key policy in the application to retrieve secrets by using the AWS SDK.
- C. Store the database credentials in the application code. Separate credentials by using environment-specific branches that have restricted access to the code repositories.
- **D. Store database credentials and API keys in AWS Secrets Manager. Use AWS managed AWS KMS keys. Set up automatic key rotation. Use the AWS SDK to retrieve secrets.**

Answer: D

Explanation:

Requirement Summary:

- * Multi-tier app on EC2 + Aurora PostgreSQL
- * Must comply with least privilege and security policies
- * Need to manage credentials and API keys securely
- * Must support key rotation on demand

Evaluate Options:

A. Secrets Manager + AWS managed KMS keys

- * # Best practice for secure secret storage
- * # Supports auto rotation
- * # Uses AWS SDK to fetch at runtime (secure, avoids hardcoding)
- * AWS managed keys are rotated automatically and easier to manage

B). Secrets Manager + customer managed keys

- * ## Also valid, but adds complexity
- * Since the question asks for LEAST development effort, AWS-managed keys are preferred C). Store secrets in code
- * # Violates all security best practices

D). Use SSM Parameter Store + AWS managed keys

- * ## Possible, but Secrets Manager is preferred when rotation is needed
- * Parameter Store does not natively rotate secrets
- * Secrets Manager: <https://docs.aws.amazon.com/secretsmanager/latest/userguide/intro.html>
- * Automatic key rotation: <https://docs.aws.amazon.com/kms/latest/developerguide/rotate-keys.html>
- * Best practices for secret management: <https://docs.aws.amazon.com/secretsmanager/latest/userguide/best-practices.html>
