100% Pass Quiz 2026 High-quality SOA-C03: Free AWS Certified CloudOps Engineer - Associate Updates

The rapid development of information will not infringe on the learning value of our SOA-C03 exam questions, because our customers will have the privilege to enjoy the free update for one year. You will receive the renewal of SOA-C03 study files through the email. And our SOA-C03 study files have three different version can meet your demands. Firstly, PDF version is easy to read and print. Secondly software version does not limit to the number of installed computers, and it simulates the real SOA-C03 Actual Test guide, but it can only run on Windows operating system. Thirdly, online version supports for any electronic equipment and also supports offline use at the same time. For the first time, you need to open SOA-C03 exam questions in online environment, and then you can use it offline. All in all, helping our candidates to pass the exam successfully is what we always looking for. SOA-C03 actual test guide is your best choice.

Amazon AWS Certified CloudOps Engineer - Associate Sample Questions (Q10-Q15):

NEW QUESTION # 10

A company has a microservice that runs on a set of Amazon EC2 instances. The EC2 instances run behind an Application Load Balancer (ALB).

A CloudOps engineer must use Amazon Route 53 to create a record that maps the ALB URL to example.com. Which type of record will meet this requirement?

- A. An alias record
- B. An A record
- C. A CNAME record
- D. An AAAA record

Answer: A

Explanation:

An alias record is the recommended Route 53 record type to map domain names (e.g., example.com) to AWS-managed resources such as an Application Load Balancer. Alias records are extension types of A or AAAA records that support AWS resources directly, providing automatic DNS integration and no additional query costs.

"Use alias records to map your domain or subdomain to an AWS resource such as an Application Load Balancer, CloudFront distribution, or S3 website endpoint." A and AAAA records are used for static IP addresses, not load balancers. CNAME records cannot be used at the root domain (e.g., example.com). Thus, Option C is correct as it meets CloudOps networking best practices for scalable, managed DNS resolution to ALBs.

NEW QUESTION # 11

A CloudOps engineer created a VPC with a private subnet, a security group allowing all outbound traffic, and an endpoint for EC2 Instance Connect in the private subnet. The EC2 instance was launched without an SSH key pair, using the same subnet and security group. However, the engineer cannot connect via EC2 Instance Connect endpoint.

How can the CloudOps engineer connect to the instance?

- A. Create an IAM instance profile that allows AWS Systems Manager Session Manager to access the EC2 instance. Associate the instance profile with the instance.
- B. Create an inbound rule in the security group to allow SSH traffic on port 22 from the private subnet.
- C. Create an inbound rule in the security group to allow HTTPS traffic on port 443 from the private subnet.
- D. Recreate the EC2 instance. Associate an SSH key pair with the instance.

Answer: A

Explanation:

According to the AWS Cloud Operations and EC2 Connectivity documentation, EC2 Instance Connect Endpoint allows access to instances without internet exposure or open SSH ports. However, for successful connectivity, the EC2 instance must have Systems Manager permissions through an IAM instance profile.

If no IAM instance profile is attached, the instance cannot establish a control channel with the Systems Manager service, and EC2 Instance Connect cannot authenticate the session.

Opening port 22 (Option B) is unnecessary and contradicts the private subnet design. HTTPS rules (Option C) are irrelevant because EC2 Instance Connect communicates through AWS APIs, not direct HTTPS connections. Recreating the instance with a key pair (Option D) bypasses the intended keyless connection mechanism.

Therefore, Option C - attaching an IAM instance profile with Systems Manager permissions - enables secure, private access through EC2 Instance Connect Endpoint.

NEW QUESTION # 12

A CloudOps engineer is creating a simple, public-facing website running on Amazon EC2. The CloudOps engineer created the EC2 instance in an existing public subnet and assigned an Elastic IP address to the instance. Next, the CloudOps engineer created and applied a new security group to the instance to allow incoming HTTP traffic from 0.0.0.0/0. Finally, the CloudOps engineer created a new network ACL and applied it to the subnet to allow incoming HTTP traffic from 0.0.0.0/0. However, the website cannot be reached from the internet.

What is the cause of this issue?

- A. There is an additional network ACL associated with the subnet that includes a rule that denies inbound HTTP traffic from port 80.
- B. The Elastic IP address assigned to the EC2 instance has changed.
- C. The CloudOps engineer did not create an outbound rule in the security group that allows HTTP traffic from port 80.
- **D. The CloudOps engineer did not create an outbound rule that allows ephemeral port return traffic in the new network ACL.**

Answer: D

Explanation:

Network ACLs are stateless, meaning that return traffic for allowed inbound connections must be explicitly permitted by outbound rules. Although the inbound rule allows HTTP (port 80) from 0.0.0.0/0, if the outbound rule does not allow ephemeral ports (typically 1024–65535), return traffic from the web server to clients will be blocked, preventing users from accessing the website.

NEW QUESTION # 13

A company requires the rotation of administrative credentials for production workloads on a regular basis. A CloudOps engineer must implement this policy for an Amazon RDS DB instance's master user password.

Which solution will meet this requirement with the LEAST operational effort?

- A. Create a new String parameter in AWS Systems Manager Parameter Store. Configure automatic rotation.
- B. Create an AWS Lambda function to change the RDS master user password. Create an Amazon EventBridge scheduled rule to invoke the Lambda function.
- C. Create a new SecureString parameter in AWS Systems Manager Parameter Store. Encrypt the parameter with an AWS Key Management Service (AWS KMS) key. Configure automatic rotation.
- **D. Create a new RDS database secret in AWS Secrets Manager. Apply the secret to the RDS DB instance. Configure automatic rotation.**

Answer: D

Explanation:

AWS Secrets Manager natively supports credential management and automatic rotation for Amazon RDS master user passwords. When a secret is associated with an RDS instance, Secrets Manager automatically updates the password both in the secret and on the database, without downtime or manual scripting.

AWS documentation confirms:

"AWS Secrets Manager can automatically rotate the master user password for Amazon RDS databases. Rotation is fully managed and integrated, requiring no custom code or maintenance." Option A introduces unnecessary Lambda automation. Option B and C use Parameter Store, which does not provide direct RDS password rotation. Therefore, Option D achieves secure, automatic credential rotation with least operational effort, fully aligned with CloudOps security automation principles.

NEW QUESTION # 14

A company needs to enforce tagging requirements for Amazon DynamoDB tables in its AWS accounts. A CloudOps engineer must implement a solution to identify and remediate all DynamoDB tables that do not have the appropriate tags.

Which solution will meet these requirements with the LEAST operational overhead?

- A. Create an Amazon EventBridge managed rule to evaluate all DynamoDB tables for the appropriate tags. Configure the EventBridge rule to run an AWS Systems Manager Automation custom runbook for remediation.
- B. Create a custom AWS Lambda function to evaluate and remediate all DynamoDB tables. Create an AWS Config custom rule to invoke the Lambda function.
- C. Create a custom AWS Lambda function to evaluate and remediate all DynamoDB tables. Create an Amazon EventBridge scheduled rule to invoke the Lambda function.
- **D. Use the required-tags AWS Config managed rule to evaluate all DynamoDB tables for the appropriate tags. Configure an automatic remediation action that uses an AWS Systems Manager Automation custom runbook.**

Answer: D

Explanation:

According to the AWS Cloud Operations, Governance, and Compliance documentation, AWS Config provides managed rules that automatically evaluate resource configurations for compliance. The "required-tags" managed rule allows CloudOps teams to specify mandatory tags (e.g., Environment, Owner, CostCenter) and automatically detect non-compliant resources such as DynamoDB tables.

Furthermore, AWS Config supports automatic remediation through AWS Systems Manager Automation runbooks, enabling correction actions (for example, adding missing tags) without manual intervention. This automation minimizes operational overhead and ensures continuous compliance across multiple accounts.

Using a custom Lambda function (Options A or B) introduces unnecessary management complexity, while EventBridge rules alone (Option D) do not provide resource compliance tracking or historical visibility.

Therefore, Option C provides the most efficient, fully managed, and compliant CloudOps solution.
