Salesforce Salesforce-MuleSoft-Developer-I 시험요강:

주제	소개
주제 1	<ul style="list-style-type: none"> Deploying and Managing APIs and Integrations: It includes packaging Mule applications for deployment and deploying them to CloudHub. This topic also involves using CloudHub properties, creating and deploying API proxies, connecting an API implementation to API Manager, and applying policies to secure an API.
주제 2	<ul style="list-style-type: none"> Handling Errors: Handling errors includes describing default error handling in Mule applications and defining custom global default error handlers. It involves comparing On Error Continue and On Error Propagate scopes, creating error handlers for a flow, using the Try scope, and mapping errors to custom application errors.
주제 3	<ul style="list-style-type: none"> Debugging and Troubleshooting Mule Applications: Using breakpoints to inspect a Mule event during runtime, installing missing Maven dependencies, and reading and deciphering Mule log error messages are sub-topics of this topic.
주제 4	<ul style="list-style-type: none"> Structuring Mule Applications: Structuring Mule applications covers parameterizing an application and defining and reusing global configurations. It includes breaking an application into multiple flows using private flows, subflows, and the Flow Reference component.
주제 5	<ul style="list-style-type: none"> Building API Implementation Interfaces: This topic involves manually creating a RESTful interface for a Mule application and generating a REST Connector from a RAML specification. It also includes describing the features and benefits of APIkit.
주제 6	<ul style="list-style-type: none"> Designing APIs: Designing APIs involves describing the lifecycle of the modern API and using RAML to define various aspects of an API. It includes identifying when to use query parameters vs URI parameters, and defining API parameters.

주제 7	<ul style="list-style-type: none"> Using Connectors: It focuses on retrieving data from REST services using HTTP Request or REST Connector. Moreover, the topic covers using a Web Service Consumer connector for SOAP web services and the Transform Message component.
주제 8	<ul style="list-style-type: none"> Processing Records: Processing records includes methods for processing individual records in a collection and explaining how Mule events are processed by the For Each scope. It also involves using the Batch Job with Batch Steps and a Batch Aggregator.
주제 9	<ul style="list-style-type: none"> Transforming Data with DataWeave: It involves writing DataWeave scripts and using DataWeave functions. This topic also includes defining and using DataWeave variables, functions, and modules, and applying correct syntax.
주제 10	<ul style="list-style-type: none"> Routing Events: It focuses on using the Choice router for conditional logic and the Scatter-Gather router to multicast events. This topic also involves validating data by using the Validation module.

Refer to the exhibit.

What is the correct syntax to add a customer ID as a URI parameter in an HTTP Listener's path attribute?

- A. (customerID)
- B. \${customerID}
- C. {customerID}
- D. #[customerID]

정답: C

질문 # 59

Refer to the exhibits. The webClient flow sends requests to the mockServer Row's HTTP Listener.

An HTTP: METHOD_NOT_ALLOWED error is thrown each time the webClient flow executes.

What attribute value must be changed in the webClient flow's HTTP Request operation to prevent this error from being thrown?

- A. Change the path attribute's value to `7api/partners/fastShopping`"
- **B. Change the method attribute's value to "POSTL"**
- C. Change the protocol attribute's value to "HTTPS"
- D. Change the method attribute's value to "*"

정답: B

질문 # 60

How would you debug Mule applications?

- **A. Using debugger component**
- B. Use third party debugger application
- C. Checking RAML specifications
- D. By Deploying apps on production

정답: A

설명:

Debugger can be used to debug applications to see event data move from one flow to other

질문 # 61

Refer to the exhibit.

```

            type: Plan[]
            example: !include ACME/Examples/PlanExamples.raml
```

• D.

정답: D

설명:

As can be seen in RAML, POST expects input in application/json format which eliminates two of the options as two options are in xml format.

Now out of the two remaining options, one has id field in request which is only mentioned for get response and not for POST request. Hence id field is not expected in POST request.

Hence correct answer is

```
{
  "name": "GoerdiLa Forge",
  "address": "1 Westland CA",
  "customer_since": "2014-01-04",
  "balance": "4829.29",
  "bank_agend_id": "12556"
}
```

질문 # 62

Where is metadata stored in a Mule project

- A. Config.yaml file
- B. application-types.xml
- C. POM.xml file
- D. Global Element

정답: B

설명:

Metadata is stored in application-types.xml file located under src/main/resources.

Mule 4 applications contain an application-types.xml file, which is where metadata around your data types is stored. For example, if you create a new CSV type, that metadata will be added to this file. This new file is easy to share, commit, and merge when conflicts arise, which enables you to do more metadata-driven development.
