Archer-Expertブロンズ教材、Archer-Expert模試エンジン

進歩を続けることは、すべての人にとって非常に良いことです。継続的に自分自身を改善するために最善を尽くすと、お金、幸福、良い仕事などを含め、たくさん収穫することになります。当社のArcher-Expert準備試験は、進歩を続けるのに役立ちます。私たちのArcher-Expert学習教材を選択すると、あなたの欠点を克服し、永続的な人になることは非常に簡単であることがわかります。Archer-Expert試験問題を購入することに決めた場合、Archer-Expert試験に合格し、短時間で正常に認定を取得できる可能性があります。

Archer Certified Administrator-Expert 認定 Archer-Expert 試験問題 (Q32-Q37):

質問 # 32

For multi-host environments, which statement of the following is TRUE regarding the set up of the servers?

- A. All Archer components exist on one server.
- B. A load balancer is not needed if there are more than one web server.
- **C. All servers should be on the same network.**
- D. File share can only be accessed by the web server.

正解: C

解説:

In a Multi-Host (Distributed) Environment, Archer components (Web, Application, and Database tiers) are spread across multiple physical or virtual machines to ensure high availability and scalability. According to the Archer Installation and Troubleshooting guides within the Administration II curriculum, it is a technical requirement that all servers within the Archer instance be on the same network or have high-speed, low-latency connectivity between them. This is because the Archer Control Panel (ACP) and the various services (Async, Indexing, Queuing) must communicate constantly to synchronize metadata and process jobs.

Option A is incorrect because the File Store must be accessible by both the Web and Services servers to handle attachments.

Option B describes a "Single-Host" setup, not a multi-host one. Option C is false because if you have multiple Web Servers, a Load Balancer is mandatory to distribute user traffic and provide failover. Without being on the same network/segment, the latency would cause the Archer Services to "time out," leading to job engine failures and significant performance degradation across the platform.

質問 # 33

When importing data through the Data Import Wizard, if you choose the Import Type as "Update Existing Records", which of the following is true?

- A. Matching records will be discarded and unmatched records will be added as new records.
- B. A number of the matching records will be updated.
- C. Matching records will be updated and unmatched records will be added as new records.
- **D. Matching records will be updated and unmatched records will be discarded.**

正解: D

解説:

The Data Import Wizard offers three distinct processing modes: "Add New Records," "Update Existing Records," and "Add New and Update Existing Records." According to the Archer Administration II curriculum, the "Update Existing Records" mode is highly restrictive. It is used when an administrator only wants to modify records that already reside in the system.

During the import, Archer uses the specified Key Field(s) to find matches between the source file and the target application. If a match is found, the existing record is updated with the new data from the source file.

However, if a row in the source file does not have a corresponding match in Archer, that row is simply ignored and discarded. No new records are created. This is a safety measure to prevent the accidental creation of "orphan" or duplicate data when the intent is strictly maintenance of existing content. If an administrator wishes to both update matches and create new records for non-matches, they must specifically choose the "Add New and Update Existing Records" (Upsert) option.

質問 # 34

Which API(s) are capable of running Archer reports?

- A. Content API
- B. RESTful API
- **C. SOAP API**
- D. All of the Archer APIs

正解: C

解説:

While Archer has been aggressively moving toward the RESTful API (Option C) for modern integrations, the ability to execute an existing Archer Report and retrieve the results has historically been a core function of the SOAP API (Web Services). Specifically, the SearchSvc (Search Service) within the SOAP API includes the ExecuteSearch and SearchRecordsByReport methods.

According to the Archer Administration II technical integration documents, the RESTful API is primarily designed for CRUD operations (Create, Read, Update, Delete) on individual records and metadata. While newer versions of the REST API are expanding, the legacy SOAP Web Services remain the primary, verified method for triggering a pre-defined "Saved Report" via an external call. The Content API (Option D) is a subset of the RESTful API focused on record data but lacks the high-level report execution engine found in the SOAP services.

質問 # 35

What does the Archer Job Monitor front-end report display?

- A. User access logs
- B. System performance metrics
- **C. A list of all jobs and their run history**
- D. Security alerts

正解: C

解説:

The Archer Job Monitor is a dedicated administrative interface found within the "Administration" workspace. It is the primary dashboard for monitoring the health of the Archer Job Engine. According to the curriculum, the Job Monitor provides visibility into both scheduled and ad-hoc background tasks, including Data Feeds, Data Publication, Notifications, and Recalculations.

The report displays a chronological list of jobs, their current status (Queued, In Progress, Completed, or Failed), and their start/end times. This is the first place an administrator looks if a notification wasn't sent or a data feed didn't update. Unlike "User access logs"

(which track logs) or "System performance metrics" (which are found in the ACP or IIS), the Job Monitor is focused strictly on the execution history of background system tasks, allowing administrators to identify bottlenecks or specific job failures without needing access to the server's event logs.

質問 # 36

What is the first step in creating a calculated field?

- A. Enable the calculated field option from the field's properties
- B. Writing the calculation formula in Archer
- C. Creating a User/Groups List field
- D. Validating your formula

正解: A

解説:

In the Archer platform, a "Calculated Field" is not a separate field type you select from the initial list (like Text or Date). Instead, almost any standard field type can be transformed into a calculated one. According to the Archer Administration II curriculum, the foundational step is to create the field first and then go into the field's General Tab properties to check the box labeled "Calculate its value." Once this option is enabled, the "Formula" and "Calculation Properties" tabs appear, allowing the administrator to define the logic. You cannot write a formula (Option A) or validate it (Option D) until the field has been designated as a calculated field. Option C is irrelevant as a "first step," as calculations can be applied to many field types, not just User/Groups lists. By enabling the calculation property first, you signal to the Archer Calculation Engine that this field's value will be managed by the system rather than by manual user input.
