## Salesforce Platform Developer II Sample Questions (Q87-Q92):

### NEW QUESTION # 87

A developer is asked to look into an issue where a scheduled Apex is running into DML limits. Upon investigation, the developer finds that the number of records processed by the scheduled Apex has recently increased to more than 10,000. What should the developer do to eliminate the limit exception error?

- A. Implement the Queueable interface.
- **B. Implement the Batchable interface.**
- C. Use platform events.
- D. Use the `@future` annotation.

**Answer: B**

Explanation:

The best way to eliminate the limit exception error is to implement the Batchable interface. The Batchable interface allows the developer to create a class that can process large sets of data in batches, and execute logic for each batch of records. The developer can use the Database.executeBatch method to invoke the batch class, and specify the batch size and the scope of records to process. This way, the developer can avoid hitting the DML limits, as each batch of records will have its own set of governor limits. Using the @future annotation will not help, as it will only defer the execution of the method to a later time, but it will not split the records into batches, and it will still hit the DML limits. Implementing the Queueable interface will not help, as it will only allow the developer to chain asynchronous jobs, but it will not split the records into batches, and it will still hit the DML limits. Using platform events will not help, as they are used to communicate changes in data or processes across the system, but they will not split the records into batches, and they will still hit the DML limits. #### NEW QUESTION # 88

A developer is debugging an Apex-based order creation process that has a requirement to have three savepoints, SP1, SP2, and SP3 (created in order), before the final execution of the process.

During the final execution process, the developer has a routine to roll back to SP1 for a given condition. Once the condition is fixed, the code then calls 2 roll back to SP3 to continue with final execution. However, when the roll back to SP3 is called, a Runtime error occurs.

Why does the developer receive a runtime error?

- A. The developer used too many savepoints in one trigger session.
- **B. SP3 became invalid when SP1 was rolled back.**
- C. The developer should have called SF2 before calling SP3.
- D. The developer has too many DML statements between the savepoints.

**Answer: B**

Explanation:

Savepoints in Apex are markers within a transaction and rolling back to an earlier savepoint (SP1) invalidates any savepoints created after it. Thus, SP3 is invalidated when the code rolls back to SP1, causing a runtime error when a rollback to SP3 is attempted.

#### NEW QUESTION # 89

For compliance purposes, a company is required to track long-term product usage in their org. The information that they need to log will be collected from more than one object and, over time, they predict they will have hundreds of millions of records.

What should a developer use to implement this?

- **A. Big objects**
- B. Field history tracking
- C. Setup audit trail
- D. Field audit trail

**Answer: A**

Explanation:

Big objects provide a solution for storing and managing large amounts of data within Salesforce. They are ideal for compliance purposes when tracking long-term usage data that will accumulate over time into very large record counts.

#### NEW QUESTION # 90

Universal Containers (UC) has an CRP system that stores customer information.

When an Account is created in Salesforce, the FRP system's REST endpoint for creating new customers must automatically be called with the Account information. If the call to the ERP system fails, the Account should still be created. Accounts in UC org are only created, one at a time, by users in the customer on-boarding department.

What should a developer to make the call to the CRP system's REST endpoint?

- A. REST call from JavaScript
- **B. call a Queueable from a Trigger**

- C. apex Continuation
- D. Headless Quick Action

**Answer: B**

Explanation:

According to 1, REST API provides you with programmatic access to your data in Salesforce. You can use REST API to make HTTP requests to Salesforce endpoints and perform operations on your data. However, you also need to authenticate your requests using OAuth endpoints 2.

According to 3, you can use Queueable Apex to schedule batch send the data from Salesforce to another system using REST API. Queueable Apex allows you to run asynchronous jobs that can be chained and monitored. You can call a Queueable class from a trigger to enqueue the job after an Account is created.

Therefore, using a Queueable from a Trigger seems to be the best way to make the call to the ERP system's REST endpoint.

### NEW QUESTION # 91

What is the correct syntax for calling a controller action from a Visualforce page and updating part of the page once the action is completed? Choose 2 answers
