NCARB PDD 시험요강:

주제	소개
주제 1	<ul style="list-style-type: none"> • Construction Cost: This section of the exam measures the skills of Construction Managers and focuses on the financial side of project execution. It evaluates the ability to analyze construction cost estimates to confirm that they align with project design intent and budgetary constraints. Although this is the smallest section, it is critical for ensuring projects remain feasible and economically viable.
주제 2	<ul style="list-style-type: none"> • Integration of Building Materials & Systems: This section of the exam measures the skills of Architectural Designers and focuses on the ability to resolve and integrate various building systems into cohesive project goals. It covers analyzing architectural systems and technologies, determining the size of structural, mechanical, electrical, and plumbing systems, and incorporating specialty systems such as acoustics, lighting, security, and communications. It also evaluates the ability to detail how multiple building systems work together and to coordinate across disciplines to achieve a unified design.
주제 3	<ul style="list-style-type: none"> • Codes & Regulations: This section of the exam measures skills of Building Code Specialists and examines how codes and regulations apply at a detailed level during documentation. Candidates are expected to demonstrate knowledge of compliance with the International Building Code (IBC) as well as other specialty regulations, as well as how to interpret and apply these standards to ensure design and documentation meet legal and safety requirements.
주제 4	<ul style="list-style-type: none"> • Project Manual & Specifications: This section of the exam measures the skills of Specifications Writers and emphasizes the importance of developing documentation that goes beyond drawings. Candidates must understand how to identify and prioritize elements needed to prepare, maintain, and refine both the project manual and project specifications. It also assesses the ability to align and coordinate these specifications with the construction documents to ensure consistency and accuracy.
주제 5	<ul style="list-style-type: none"> • Construction Documentation: This section of the exam measures skills of Project Architects and addresses the creation and management of project documentation. Candidates are expected to demonstrate knowledge of documenting building design and site features, preparing detailed architectural drawings, and applying industry standards to produce a coordinated set of construction documents. The section also includes understanding how project changes impact documentation and how to communicate these updates effectively to both the design team and the client.

질문 # 92

For the same moment, a glue-laminated beam would require a section modulus of what proportion relative to a sawn timber beam? (Assume F# of the glue-laminated beam is 2,400 psi and F# of the sawn lumber beam equals 1,200 psi.)

- A. 0
- B. 3/4
- C. 1/2
- D. The same

정답: C

설명:

Comprehensive Detailed Explanation with all NCARB ARE 5.0 Project Development and Documentation (PDD) Study Guide References:

The question is about the relative section modulus (S) required for a glue-laminated beam vs. a sawn timber beam to resist the same bending moment. The formula relating bending stress (Fb), moment (M), and section modulus (S) is:

$$Fb = \frac{M}{S} \Rightarrow S = \frac{M}{Fb}$$

For the same bending moment M, the section modulus is inversely proportional to the allowable bending stress

- F_b of glue-laminated beam = 2,400 psi
- F_b of sawn timber beam = 1,200 psi

Calculate relative section modulus:

$$\frac{S_{glulam}}{S_{sawn}} = \frac{F_{b,sawn}}{F_{b,glulam}} = \frac{1,200}{2,400} = \frac{1}{2}$$

Therefore, the glue-laminated beam requires half the section modulus compared to the sawn timber beam.

질문 # 93

Which of the following is most appropriate to coordinate ceiling-mounted HVAC diffusers?

- A. Reflected ceiling plan
- B. Structural framing plan
- C. Roof plan
- D. Floor finish plan

정답: A

설명:

Reflected ceiling plans (RCPs) show locations of diffusers, lighting, ceiling grids, etc. Critical for coordinating mechanical with electrical and architectural elements. Related to Objective 3.1: Coordination of disciplines.

질문 # 94

Owners of a busy two-story theater complex want to renovate. The new renovations include increasing the second floor lobby and doubling the number of second floor movie screens. The owner favors the use of escalators. Movies are scheduled to start simultaneously every three hours. The theater currently has a pair of 24-inch-wide parallel escalators, one of which goes up and the other down.

Which of the following should be proposed to accommodate the increased traffic to the second floor?

- A. Install a new elevator in the lobby
- B. Increase the existing escalator speeds to 130 fpm
- C. Install a new escalator that reverses direction
- D. Extend balustrades at escalator landings

정답: C

설명:

Given:

The theater doubles its second-floor movie screens, increasing patron traffic.

Existing escalators are two 24-inch wide units, one up and one down, with simultaneous movie start times every 3 hours.

To handle increased traffic:

Increasing existing escalator speed to 130 fpm (option A) is limited by safety and code limits (typically max around 100 fpm); also increases wear.

Installing a new elevator (option B) is helpful for accessibility but does not efficiently handle high flow of large crowds during peak.

Installing a new escalator that reverses direction (option C) (also called a "dance" or "two-way" escalator) allows flexibility to accommodate peak traffic flow-e.g., two escalators up during rush times and one down, or vice versa.

Extending balustrades (option D) improves safety but does not increase capacity.

Therefore, option C is the best solution to manage increased passenger flow.

질문 # 95

In the critical path method of scheduling for new construction, the site work portion is always on the critical path due to which of the following?

- A. Site cost is usually a high percentage of the total work.
- B. Retainage for site work is held until the end of the project.
- C. Site work is dependent upon short interval scheduling.
- **D. Site work must be completed linearly.**

정답: D

설명:

In the Critical Path Method (CPM) scheduling, the critical path is the longest sequence of dependent activities that determines the project duration.

Site work typically involves grading, excavation, underground utilities, and foundation preparation.

Site work must proceed in a linear, sequential manner: earthwork must finish before foundation pours; utilities are installed before slabs.

These activities are dependent on each other and cannot be done in parallel or out of order.

Therefore, site work forms a continuous chain of dependent activities on the critical path.

Other options are less relevant to CPM critical path logic:

Site work costs or retainage do not influence CPM scheduling.

Short interval scheduling is a project control technique, not a CPM determinant.

To identify the discrepancy between the drawings and the Room Finish Schedule for Room 101, compare what's shown in the restroom elevation and plan versus the listed finishes.

Step-by-step comparison:

* Room 101 (Women's Restroom) is shown with:

* Wall finish: Clearly shows tile (CT) on the lower half of the walls in the elevation.

* But in the finish schedule, Room 101 has "PT" (paint) listed under wall finish.

Therefore, the error is in the wall finish cell for Room 101, which should show CT (ceramic tile), not PT (paint).
