VMware 2V0-17.25 認定試験の出題範囲:

トピック	出題範囲

トピック 1	• Deploy, Configure, and Operate VMware Cloud Foundation (VCF): This section of the exam measures the skills of VCF Administrators and goes in-depth into deploying, configuring, and managing VMware Cloud Foundation. The deployment portion covers identifying deployment models, configuring private cloud environments, and setting up workload domains and networking. The management objectives focus on lifecycle operations such as fleet management, identity and role-based access, licensing, certificate handling, and importing existing vCenters. Operations are assessed through capabilities like monitoring health, logs, networks, and storage, along with creating dashboards, configuring alerts, and ensuring compliance. The automation portion evaluates skills in using VCF Automation for multi-tenancy, provider networking, content libraries, governance policies, and extensibility to automate business processes. It also includes knowledge of deploying Supervisor-based services within Cloud Foundation.
トピック 2	• VMware Cloud Foundation Fundamentals: This section of the exam measures the skills of Private Cloud Engineers and covers the basic building blocks of VMware Cloud Foundation. It includes the vision and use cases for private cloud, along with the value it provides to businesses. Candidates are expected to understand compute fundamentals such as deploying and managing vCenter, ESXi, clusters, and virtual machines. Storage fundamentals include configuring vSphere storage, setting up vSAN clusters, applying storage policies, and understanding resilience options. Networking fundamentals are also assessed, with a focus on configuring connectivity, fabrics, routing, and network services in a VMware environment.
トピック 3	• Plan and Design the VMware by Broadcom Solution: This section of the exam measures the skills of Solution Designers and emphasizes the ability to plan and design VMware by Broadcom solutions. Although no testable objectives are defined here, it reinforces the importance of architectural planning and design considerations for large-scale cloud deployments.
トピック 4	• IT Architectures, Technologies, Standards: This section of the exam measures the skills of Cloud Architects and focuses on understanding the broader context of IT architectures, common technologies, and industry standards. While it does not have testable objectives, it sets the foundation for how VMware Cloud Foundation aligns with enterprise cloud strategies.

VMware Cloud Foundation 9.0 Administrator 認定 2V0-17.25 試験問題 (Q64-Q69):

質問 # 64

While deploying the first VI workload domain in a VMware Cloud Foundation (VCF) solution, which two steps will always be performed by SDDC Manager? (Choose two.)

- A. Deploy and configure a new vCenter Server instance for the VI workload domain.
- B. Connect a new vCenter Server instance to the Application Virtual Network.
- C. Deploy a new NSX Manager instance for the VI workload domain.
- D. Deploy an NSX Edge cluster and configure BGP routing on the T0 Gateway.
- E. Configure vSAN as a principal storage for the VI workload domain.

正解: A、C

解説:

SDDC Manager always deploys a dedicated NSX Manager instance and a new vCenter Server for each VI workload domain during initial deployment.

質問 # 65

Which tool is most appropriate for analyzing detailed network performance metrics in a vSphere environment?

- A. vSAN Health Service
- B. Aria Operations
- C. vSphere Client
- D. vSphere CLI

正解: B

解説:

Aria Operations (formerly vRealize Operations) is the most appropriate tool for analyzing detailed network performance metrics in a vSphere environment. It provides comprehensive monitoring, analytics, and performance management, including network performance metrics across the vSphere infrastructure.

質問 # 66

When designing a vSAN cluster for high availability and performance, which of the following design considerations are typically applied?

- A. Monitoring vSAN health checks regularly for early issue detection
- B. Setting an appropriate Failure Tolerance Method (RAID-1 or RAID-5/6)
- C. Ensuring each host has a cache tier SSD and a capacity tier
- D. Using a single NIC for vSAN, vMotion, and Management to reduce complexity

正解: A、B、C

解説:

A balanced design with cache/capacity tiers (A), suitable RAID levels for fault tolerance (C), and regular health checks (D) are key. Combining all traffic on one NIC (B) can create bottlenecks and is not recommended.

質問 # 67

When setting up a new port group on a Virtual Distributed Switch (VDS), what role does configuring a VLAN ID play in network management and traffic isolation?

- A. To improve the performance of virtual machines by distributing network traffic across multiple uplinks
- B. To configure storage replication settings for virtual machines connected to the port group
- C. To enable the automatic assignment of IP addresses to virtual machines in the port group
- D. To logically segment network traffic by assigning the port group to a specific VLAN, ensuring that traffic is isolated

正解: D

解説:

Assigning a VLAN ID to a VDS port group ensures that all traffic on that port group is tagged for and confined to the specified VLAN, providing logical segmentation and isolation of network traffic.

質問 # 68

An administrator needs to perform lifecycle management for their VMware Cloud Foundation components, including upgrading the SDDC Manager.

Which three steps should be followed to successfully upgrade VMware Cloud Foundation? (Choose three.)

- A. Use the SDDC Manager UI to initiate the upgrade process.
- B. Backup all VMware Cloud Foundation components before starting the upgrade.
- C. Perform a pre-check to ensure that all components are compatible with the new version.
- D. Manually download the update bundles with a secure browser from the VMware website.
- E. Disable DRS and HA on all clusters before initiating the upgrade.

正解: A、B、C

解説:

Backing up all VMware Cloud Foundation components ensures that data is protected in case the upgrade process encounters issues.

Performing a pre-check is important to verify that all components are compatible with the new version to avoid compatibility issues during the upgrade process.

The SDDC Manager UI is used to initiate the upgrade process, providing a guided and consistent method for upgrading the VMware Cloud Foundation environment.
