Cisco Supporting Cisco Devices for Field Technicians Sample Questions (Q48-Q53):

NEW QUESTION # 48

Which management option is best suited for standalone Cisco Secure Firewall deployments?

- A. Cisco Secure Firewall Management Center
- B. Cisco Security Manager
- C. Cisco Secure Firewall Device Manager
- D. Cisco Defense Orchestrator

Answer: C

Explanation:

For standalone Cisco Secure Firewall deployments, the Cisco Secure Firewall Device Manager (FDM) is the most appropriate management option. FDM is a browser-based, on-box management tool that allows administrators to configure and manage a single firewall device without the need for external management infrastructure. It provides an intuitive interface for basic configurations, policy management, and monitoring.

In contrast:

* Cisco Secure Firewall Management Center (FMC) is designed for centralized management of multiple firewall devices.

- * Cisco Defense Orchestrator (CDO) is a cloud-based solution for managing security policies across various devices.
 - * Cisco Security Manager is an older platform primarily used for managing ASA devices.

NEW QUESTION # 50

What is the primary advantage of the Cisco Intersight cloud-based approach compared to traditional on-premises management tools?

- A. It requires less local storage
- B. It provides faster hardware upgrades
- **C. It allows management from anywhere without on-premises software**
- D. It offers better integration with non-Cisco products

Answer: C

Explanation:

The main advantage of Cisco Intersight is its cloud-based architecture, which allows IT administrators to manage infrastructure from any location without needing to install or maintain traditional on-premises management tools.

This provides:

- * Centralized visibility and control over UCS servers and HyperFlex infrastructure
- * Remote firmware upgrades and configuration
- * Policy-driven automation

Unlike on-premises tools, Intersight eliminates the overhead of maintaining dedicated infrastructure for management.

NEW QUESTION # 51

Which two features are managed by the hardware and software of the collaboration infrastructure? (Choose two.)

- A. Phone book administration
- **B. Facilitating connections**
- C. Hosting large-scale databases
- **D. Supporting meeting experiences**
- E. Network bandwidth allocation

Answer: B,D

Explanation:

The Cisco Collaboration Infrastructure is designed to support unified communications, video conferencing, and team collaboration through an integrated architecture involving both hardware (e.g., endpoints, media servers) and software (e.g., CUCM, Webex apps).

According to the FLDTEC course content under Cisco Collaboration Equipment and Infrastructure:

Facilitating Connections (C):

Cisco infrastructure components such as CUCM, Expressway, and Cisco Meeting Server enable real-time connections between users across voice, video, and messaging systems.

Supporting Meeting Experiences (E):

Devices such as Webex Boards, Room Kits, and Cisco Quad Cameras, in combination with platforms like Webex, provide immersive and seamless meeting experiences, supported by the infrastructure.

Incorrect Options:

A: Network bandwidth allocation: Typically managed by network QoS policies and WAN optimizations, not the collaboration infrastructure directly.

B: Hosting large-scale databases: Not a function of Cisco's collaboration system - this falls under data center or database server roles.

D: Phone book administration: Often a function within directory services or external LDAP integration, not a core collaboration infrastructure task.

NEW QUESTION # 52

Which two settings are standard Cisco console connections when configuring a terminal emulator to connect to the console port of a Cisco switch? (Choose two.)

- A. Flow control: Hardware
- **B. Speed (baud rate): 9600**
- C. Parity: Even
- D. Stop bits: 2
- **E. Data bits: 8**

Answer: B,E

Explanation:

When configuring a terminal emulator (such as PuTTY, Tera Term, or HyperTerminal) to connect to the console port of a Cisco switch, the standard settings are as follows:

Speed (baud rate): 9600

This is the default transmission speed for Cisco console ports, ensuring compatibility across various devices.

Data bits: 8

This setting specifies that each character transmitted consists of 8 data bits, which is standard for most serial communications.

Parity: None

No parity bit is used, meaning there is no additional error-checking bit appended to each character.

Stop bits: 1

One stop bit indicates the end of a character transmission.

Flow control: None

No flow control is employed, allowing continuous data transmission without hardware or software-based pausing.

Therefore, options C (Speed: 9600) and D (Data bits: 8) are correct. Options A (Stop bits: 2), B (Flow control: Hardware), and E (Parity: Even) deviate from the standard settings and may result in communication issues if configured.
