Candidates who become CompTIA DS0-001 certified demonstrate their worth in the CompTIA field. The CompTIA DataSys+ Certification Exam (DS0-001) certification is proof of their competence and skills. This is a highly sought-after skill in large CompTIA companies and makes a career easier for the candidate. To become certified, you must pass the CompTIA DataSys+ Certification Exam (DS0-001) certification exam. For this task, you need high-quality and accurate CompTIA DataSys+ Certification Exam (DS0-001) exam dumps.

CompTIA DataSys+ Certification Exam Sample Questions (Q14-Q19):

NEW QUESTION # 14

A database administrator is conducting a stress test and providing feedback to a team that is developing an application that uses the Entity Framework. Which of the following explains the approach the administrator should use when conducting the stress test?

- A. Capture business logic, check the performance of codes, and report findings.
- B. Check the clustered and non-clustered indexes, and report findings.
- C. Write queries directly into the database and report findings.
- D. Review application tables and columns, and report findings.

Answer: A

Explanation:

The approach that the administrator should use when conducting the stress test is to capture business logic, check the performance of codes, and report findings. This will help the administrator to evaluate how well the application handles high volumes of data and transactions, identify any bottlenecks or errors in the code, and provide feedback to the development team on how to improve the application's efficiency and reliability. The other options are either too narrow or too broad in scope, and do not address the specific needs of an application that uses the Entity Framework. Reference: CompTIA DataSys+ Course Outline, Domain 4.0 Data and Database Security, Objective 4.3 Given a scenario, monitor database performance and security.

NEW QUESTION # 15

Which of the following outlines why replication is important during database management?

- A. To ensure consistency, availability, and reliability between databases
- B. To ensure that an administrator can easily retrieve data from the database
- C. To ensure that all vulnerabilities within the database are classified and mitigated
- D. To ensure the performance of web applications is improved

Answer: A

NEW QUESTION # 16

Which of the following is most likely to prevent tampering with server hardware that houses data?

- A. Strong password policy
- B. Biometric locks
- C. Network firewall
- D. Surveillance cameras

Answer: B

Explanation:

The option that is most likely to prevent tampering with server hardware that houses data is biometric locks. Biometric locks are devices that use biological characteristics, such as fingerprints, facial recognition, iris scan, etc., to control access to a physical location or resource.

Biometric locks help prevent tampering with server hardware that houses data by restricting unauthorized entry or theft of the hardware by intruders or attackers. Biometric locks also provide higher security and convenience than other types of locks, such as keys or passwords, which can be lost, stolen, or forgotten. The other options are either not related or not effective for this purpose. For example, a strong password policy is a set of rules or standards for creating and managing passwords for user accounts or systems; a network firewall is a device or software that controls the incoming and outgoing traffic on a network based on a set of rules or policies; surveillance cameras are devices that capture and record video footage of a physical location or resource.

NEW QUESTION # 17

Which of the following cloud storage options provides users with endpoints to retrieve data via REST API?

- A. Ephemeral
- B. Block

- C. Object
- D. Network file

Answer: C

Explanation:

The cloud storage option that provides users with endpoints to retrieve data via REST API is object. Object storage is a type of cloud storage that stores data as objects, which consist of data, metadata, and a unique identifier. Object storage does not use any hierarchy or structure to organize data, but rather uses flat namespaces that allow users to access data using the unique identifier. Object storage also provides users with endpoints to retrieve data via REST API (Representational State Transfer Application Programming Interface), which is a standard way of communicating with web services using HTTP methods (such as GET, POST, PUT, DELETE) and formats (such as JSON, XML). Object storage is suitable for storing large amounts of unstructured data that do not require frequent changes or complex queries. The other options are either different types of cloud storage or not related to cloud storage at all. For example, network file storage is a type of cloud storage that stores data as files in folders using protocols such as NFS (Network File System) or SMB (Server Message Block); ephemeral storage is a type of temporary storage that stores data only for the duration of a session or process; iBlock is not a valid acronym or type of cloud storage.

NEW QUESTION # 18

Which of the following best describes a collection of data that shares the same properties or attributes?

- A. Tuples
- B. ER model
- C. Entity set
- D. Relation set

Answer: C

Explanation:

The option that best describes a collection of data that shares the same properties or attributes is entity set. An entity set is a term used in the entity-relationship (ER) model, which is a conceptual model for designing and representing databases. An entity set is a collection of entities that have the same type or characteristics, such as students, courses, products, etc. An entity is an object or thing that can be identified and distinguished from others, such as a specific student, course, product, etc. An entity set can have one or more attributes that describe the properties or features of the entities, such as name, age, price, etc. An entity set can also have one or more relationships with other entity sets that define how the entities are associated or connected, such as enrolled, taught by, purchased by, etc. The other options are either different terms or not related to the ER model at all. For example, relation set is a term used in the relational model, which is a logical model for implementing and manipulating databases; ER model is a term used to refer to the entity-relationship model itself; tuples are rows or records in a table or relation.
