ISQI ISTQB Certified Tester - Foundation Level Extension - Agile Tester Sample Questions (Q57-Q62):

NEW QUESTION # 57

Which of the following statements about Agile retrospectives is true?

- A. Metrics such as burndown charts, velocity, and number of stories completed could be effectively used during Agile retrospectives for process improvement
- B. An Agile retrospective should be held at the end of an iteration only when the number of story points completed by the team in that iteration is lower than the team velocity
- C. Agile retrospectives should focus exclusively on improving negative aspects, without wasting time in discussions on what worked well during the iteration
- D. All of the improvements identified in an Agile retrospective must be implemented as soon as possible during the next iteration

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

From the CTFL-AT Syllabus v4.0, Section 5.1 Agile Retrospectives and Process Improvement, it states:

"Retrospectives are used to reflect on what went well and what could be improved. They should include qualitative insights and quantitative measures such as velocity, burndown charts, and number of stories completed." Therefore, Option C is correct, as using metrics to support process improvement is a recommended best practice in retrospectives.

* Option A is incorrect - retrospectives should include what went well, not just negatives.

* Option B is inaccurate - not all improvements must be implemented immediately; they are prioritized and planned based on capacity and impact.

* Option D is false - retrospectives are held at the end of every iteration, regardless of story points completed.

NEW QUESTION # 58

Which of the following statements about a test charter are CORRECT?

- 1) It is used mainly in exploratory tests.
- 2) It is used to monitor a test process.
- 3) It may make reference to user stories.
- 4) It contains notes taken during a test session.
- 5) It is used to outline the company test policy.

- A. 1, 3, 4
- B. 1, 2, 5
- C. 2, 3, 4
- D. 2, 4, 5

Answer: D

NEW QUESTION # 59

Which of the following describes the main purpose of a task management tool in agile projects?

- A. A task management tool is used by team members to share ideas and collaborate on assigned tasks.
- B. A task management tool is used to store source code and automated tests.
- C. A task management tool is used to manage and track user stories, tests and other tasks.
- D. A task management tool allows developers to continuously integrate their code.

Answer: C

Explanation:

A task management tool is a software application that helps agile teams plan, organize, and monitor their work. A task management tool typically allows the team to create, assign, prioritize, update, and track user stories, tests, and other tasks that are part of the agile project. A task management tool can also provide various views and reports to visualize the progress and status of the project, such as Kanban boards, burndown charts, velocity charts, etc. Some examples of task management tools are Jira, Trello, Asana, and Monday.com. NEW QUESTION # 60

Which of the following statements is true in Agile projects?

- A. Shorter timeframes and frequent changes require the adoption of good practices for test design and implementation, which should be defined during release planning
- B. Test automation is important to manage regression risk because it enables version control and ensures ease of access to the tests by all team members
- C. The tests written for the features developed in earlier iterations are the most important and they should never be retired from the regression test suite
- D. The risk of regression tends to decrease when code that worked in previous iterations gets modified due to new features in subsequent iterations

Answer: A

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

From CTFL-AT Syllabus v4.0, Section 4.3 Test Automation and Continuous Integration, it states:

"Short iterations and continuous integration require well-designed automated test suites, and teams should adopt good practices for test design and implementation from the start." Option B is correct because it highlights the need for proactive test design practices to handle frequent changes - a key Agile challenge.

* Option A mixes concepts: version control relates to code, not directly to regression management.

* Option C is incorrect - regression risk increases when code is modified.

* Option D is misleading - tests may become obsolete or need refactoring, so no test is permanently untouchable.
