UiPath Automation Developer Associate v1 Exam UiPath-ADAv1 Prüfungsfragen mit Lösungen (Q363-Q368):

363. Frage

The Extract PDF Page Range activity is used to extract a specific set of pages from a PDF file. Which of the following statements correctly describes this activity?

- A. Password-protected PDF files cannot be processed with this activity.
- B. OutputFileName argument is optional.
- C. Range argument accepts complex range values or "All".
- D. PageCount argument outputs the number of extracted pages.

Antwort: C

Begründung:

The Extract PDF Page Range activity is used to extract a specific set of pages from a PDF file and save them as a new PDF file¹. The OutputFileName argument is required and specifies the path and name of the new PDF file¹. The Range argument accepts complex range values or "All" to indicate which pages to extract^{1,2}. For example, "1-3,5,7-9" will extract pages 1 to 3, 5, and 7 to 92. The PageCount argument outputs the number of pages in the original PDF file, not the extracted pages¹. Password-protected PDF files can be processed with this activity by using the Password argument to provide the password¹.

364. Frage

During the debugging process, a developer paused the execution. To alter the characteristics of the ongoing flow and change the values of variables within the existing scope.

which panel of the UiPath interface is recommended to be accessed?

- A. Execution Flow Panel
- B. Locals Panel
- C. Variables Panel
- D. Information Window

Antwort: B

Begründung:

During debugging, when the execution is paused, the "Locals" panel in UiPath Studio is the place to go to alter the characteristics of the ongoing flow and change the values of variables within the existing scope. The Locals panel shows the current state of all variables and arguments in the current scope and allows their values to be changed on-the-fly.

365. Frage

Consider testing a workflow that computes the sum of two numbers having the data driven test data from the Excel file below:

Number1	Number2	Sum
1	2	3
2	2	4
5	4	9

Expanding the functionality of the workflow to compute the sum of three numbers, the data needs to be updated as well to accommodate the new scenario:

Number1	Number2	Number3	Sum
1	2	2	5
2	2	3	7
5	4	1	10

What are steps to do that?

- A. Click Right on the Test Case and select Add Test Data.
- **B. Click Right on the Test Case and select Update Test Data.**
- C. Click Right on the Test Case and select Refresh Test Data.
- D. Click Right on the Test Case and select Remove Test Data.

Antwort: B

Begründung:

Explanation

To update the data to accommodate the new scenario, you need to modify the Excel file that contains the test data and then refresh the test case to reflect the changes. The steps are as follows:

Open the Excel file that has the test data for the workflow. It should have four columns: Number1, Number2, Sum, and Result.

Add a new column after Number2 and name it Number3. This column will store the third number for the sum operation.

Update the existing rows in the Excel file to include a value for Number3 and adjust the value of Sum accordingly. For example, if Number1 is 1, Number2 is 2, and Number3 is 3, then Sum should be 6.

Save and close the Excel file.

In UiPath Studio, right click on the test case that uses the Excel file as the test data source and select Update Test Data. This will open a window where you can edit the test data settings.

In the Update Test Data window, make sure that the Excel file path is correct and that the sheet name is selected. You can also change the name and description of the test data if you want.

Click OK to save the changes and close the window.

Right click on the test case again and select Refresh Test Data. This will reload the test data from the Excel file and update the test case accordingly.

You have successfully updated the test data to compute the sum of three numbers instead of two. You can now run or debug your test case with data variations1.

366. Frage

A developer initialized a String array, `listOfMonthsByQuarter = {"1", "2", "3"}` Which data type and value are retrieved when `listOfMonthsByQuarter(2)` is used at runtime?

- **A. Data Type. String
Value 3**
- B. Data Type: String
Value. 2
- C. Data Type Int32
Value: 2
- D. Data Type- Int32
Value: 3

Antwort: A

Begründung:

Explanation

The `listOfMonthsByQuarter` variable is a String array, which means it can store multiple values of type String.

Each value in the array has an index, which is a number that indicates its position in the array. The index starts from 0, so the first value has index 0, the second value has index 1, and so on. To access a specific value in the array, we can use the syntax `arrayName(index)`. For example, `listOfMonthsByQuarter(0)` will return the first value in the array, which is "1". Similarly, `listOfMonthsByQuarter(2)` will return the third value in the array, which is "3". Therefore, the data type of `listOfMonthsByQuarter(2)` is String, and the value is

"3". References: Arrays and Variables from UiPath documentation.
