Lpi 010-160 exam is an entry-level certification exam that validates an individual's knowledge of Linux essentials. 010-160 exam is designed to test the candidate's understanding of the core concepts of Linux and assess their ability to use the command-line interface to perform basic tasks. 010-160 Exam is divided into two parts, with the first part consisting of 40 multiple-choice questions and the second part consisting of 10 performance-based questions. 010-160 exam is conducted online and can be taken from anywhere in the world.

Lpi Linux Essentials Certificate Exam - version 1.6 Sample Questions (Q22-Q27):

NEW QUESTION # 22

Which of the following commands will search for the file foo.txt under the directory /home?

- A. search /home foo.txt
- B. find /home -name foo.txt
- C. find /home -file foo.txt
- D. find /home foo.txt
- E. search /home -file foo.txt

Answer: B

Explanation:

The correct command to search for the file foo.txt under the directory /home is find /home -name foo.txt. This command uses the find command, which is used to search for files and directories that match certain criteria. The first argument, /home, specifies the starting point of the search. The second argument, -name, indicates that the search is based on the name of the file or directory. The third argument, foo.txt, is the name of the file to be searched for. The find command will recursively search all the subdirectories under /home and print the path of any file or directory that matches the name foo.txt.

The other commands are incorrect for various reasons:

A). search /home -file foo.txt is incorrect because there is no such command as search in Linux. The correct command for searching files and directories is find.

B). search /home foo.txt is incorrect because, as mentioned above, there is no search command in Linux. Also, this command does not use any option to specify the search criteria, such as -name, -type, -size, etc.

C). find /home -file foo.txt is incorrect because the option -file is not valid. The correct option for specifying the type of file or directory is -type, followed by a letter that indicates the type, such as f for regular file, d for directory, l for symbolic link, etc. For example, find /home -type f -name foo.txt would search for a regular file named foo.txt under /home.

E). find /home foo.txt is incorrect because this command does not use any option to specify the search criteria, such as -name, -type, -size, etc. This command will search for any file or directory that has foo.txt as part of its name, not exactly as its name. For example, this command will also match a file named barfoo.txt or a directory named foo.txt.bak.

NEW QUESTION # 23

What is true about recursive directory listing?

- A. It includes the content of sub-directories.
- B. It includes a preview of content for each file in the directory.
- C. It includes details of file system internals, such as inodes.
- D. It includes the permissions of the directory listed.
- E. It includes ownership information for the files.

Answer: A

NEW QUESTION # 24

Which of the following directories must be mounted with read and write access if it resides on its own dedicated file system?

- A. /usr
- B. /lib

- C. /opt
- D. /etc
- E. /var

Answer: E

NEW QUESTION # 25

Which of the following commands finds all lines in the file operating-systems.txt which contain the term linux, regardless of the case?

- A. cut [Ll] [Ii] [Nn] [Uu] [Xx] operating-systems.txt
- B. igrep linux operating-systems.txt
- C. cut linux operating-systems.txt
- D. grep -i linux operating-systems.txt
- E. less -i linux operating-systems.txt

Answer: D

Explanation:

Explanation

The grep command is used to search for a pattern in a file or input. The -i option makes the search case-insensitive, meaning that it will match both uppercase and lowercase letters. The grep command takes the pattern as the first argument and the file name as the second argument. Therefore, the command `grep -i linux operating-systems.txt` will find all lines in the file operating-systems.txt which contain the term linux, regardless of the case. NEW QUESTION # 26

What is true about a recursive directory listing?

- A. It includes a preview of content for each file in the directory.
- B. It includes the content of sub-directories.
- C. It includes details of file system internals, such as inodes.
- D. It includes the permissions of the directory listed.
- E. It includes ownership information for the files.

Answer: B

Explanation:

Explanation

A recursive directory listing is a way of displaying the files and folders in a directory and all its sub-directories. The recursive option can be used with various commands, such as `ls`, `find`, or `dir`, to list the files recursively. For example, the command `ls -R` will list all the files and folders in the current directory and any sub-directories, showing the hierarchy of the file system. A recursive directory listing does not include the permissions, ownership, or file system details of the files, unless specified by other options. For example, the command `ls -lR` will list the files recursively and also show the permissions, ownership, size, and modification date of each file. A recursive directory listing also does not include a preview of the content of each file, unless specified by other options. For example, the command `ls -R --file-type` will list the files recursively and also show the file type indicator, such as `/` for directories, `*` for executable files, `@` for symbolic links, etc. References: 1: `ls` (Unix) - Wikipedia 2: Recursively List all directories and files - Stack Overflow 3: Why is `ls -R` called "recursive" listing? - Ask Ubuntu
