We believe that every customer pays most attention to quality when he is shopping. Only high-quality goods can meet the needs of every customer better. And our HPE6-A85 training quiz has such high quality, because its hit rate of test questions is extremely high. Perhaps you will find in the examination that a lot of questions you have seen many times in our HPE6-A85 Real Exam. And you will find our HPE6-A85 practice questions are so popular that a lot of our candidates have bought them.

The Aruba Campus Access Associate certification is ideal for individuals who have experience working with Aruba wireless and wired networking technologies. Aruba Campus Access Associate Exam certification exam tests candidates on their ability to configure and troubleshoot Aruba wireless and wired networks, as well as the ability to optimize network performance and security. The HPE6-A85 certification exam is an industry-recognized credential that verifies that the individual has the skills and knowledge required to successfully deploy and manage Aruba networks.

The Aruba Campus Access Associate Exam certification is ideal for IT professionals who are just starting their career in network administration, as well as those who are looking to expand their skillset and knowledge of Aruba's products and services. The HPE6-A85 Exam is also a great way for employers to identify individuals who have the skills and knowledge necessary to support Aruba networks in their organization.

100% Pass 2026 HPE6-A85: Newest Original Aruba Campus Access

Associate Exam Questions

There are multiple companies offering HPE6-A85 exam material in the market, so we totally understand your inquisitiveness that whom to trust. For your convenience, EduDump gives you a chance to try a free demo of HP HPE6-A85 Exam Questions, which means you can buy the product once you are satisfied with the features and you think it can actually help you to pass your certification exam.

HP Aruba Campus Access Associate Exam Sample Questions (Q66-Q71):

NEW QUESTION # 66

What is the correct command to add a static route to a class-c-network 10.2.10.0 via a gateway of 172.16.1.1?

- A. ip route-static 10.2 10.0.255.255.255.0 172.16.1.1
- B. ip-route 10.2.10.0/24 172.16.1.1
- C. ip route 10.2.10.0/24.172.16.11
- D. ip route 10.2.10.0.255.255.255.0 172.16.1.1 description aruba

Answer: B

Explanation:

The correct command to add a static route to a class-c-network 10.2.10.0 via a gateway of 172.16.1.1 is ip-route 10.2.10.0/24 172.16.1.1. This command specifies the destination network address (10.2.10.0) and prefix length (/24) and the next-hop address (172.16.1.1) for reaching that network from the switch.

The other commands are either incorrect syntax or incorrect parameters for adding a static route.

NEW QUESTION # 67

DRAG DROP

Match the Open Systems Interconnection (OSI) layer with its comparable member of the TCP/IP stack.

(Options may be used more than once.)

Answer:

Explanation:

NEW QUESTION # 68

Based on the given topology, what is the requirement on an Aruba switch to enable LLDP messages to be received by Switch 1 port 1/1/24, when Router 1 is enabled with LLDP?

- A. LLDP is enabled by default
- B. global configuration lldp enable
- C. int 1/1/24, lldp receive
- D. int 1/1/24, no cdp

Answer: A

NEW QUESTION # 69

Please match the use case to the appropriate authentication technology

Answer:

Explanation:

Explanation

Add certificates to Android devices with the Aruba Onboard Application in the Google Play store that will be used for wireless authentication A) ClearPass Policy Manager Authenticate users on corporate-owned Chromebook devices using 802.1X and

context gathered from the network devices that they log into B) Cloud Authentication and Policy Leverage unbound Mum Pre-Shared Keys (MPSK) managed by Aruo Central to the end-users and client devices B) Cloud Authentication and Policy Validate devices exist in a Mobile Device Management (MDM) database before authenticating BYOD users with corporate Active Directory using certificates A) ClearPass Policy Manager

NEW QUESTION # 70

What does WPA3-Personal use as the source to generate a different Pairwise Master Key (PMK) each time a station connects to the wireless network?

- A. Opportunistic Wireless Encryption (OWE)
- B. Key Encryption Key (KEK)
- C. Session-specific information (MACs and nonces)
- D. Simultaneous Authentication of Equals (SAE)

Answer: C

Explanation:

Explanation

The source that WPA3-Personal uses to generate a different Pairwise Master Key (PMK) each time a station connects to the wireless network is session-specific information (MACs and nonces). WPA3-Personal uses Simultaneous Authentication of Equals (SAE) to replace PSK authentication in WPA2-Personal. SAE is a secure key establishment protocol that uses a Diffie-Hellman key exchange to derive a shared secret between two parties without revealing it to an eavesdropper. SAE involves the following steps: The station and the access point exchange Commit messages that contain their MAC addresses and random numbers called nonces. The station and the access point use their own passwords and the received MAC addresses and nonces to calculate a shared secret called SAE Password Element (PE).

The station and the access point use their own PE and the received MAC addresses and nonces to calculate a shared secret called SAE Key Seed (KS).

The station and the access point use their own KS and the received MAC addresses and nonces to calculate a shared secret called SAE Key Confirmation Key (KCK).

The station and the access point use their own KCK and the received MAC addresses and nonces to calculate a confirmation value called SAE Confirm.

The station and the access point exchange Confirm messages that contain their SAE Confirm values.

The station and the access point verify that the received SAE Confirm values match their own calculated values. If they match, the authentication is successful and the station and the access point have established a shared secret called SAE PMK.

The SAE PMK is different for each session because it depends on the MAC addresses and nonces that are exchanged in each authentication process. The SAE PMK is used as an input for the 4-way handshake that generates the Pairwise Temporal Key (PTK) for encrypting data frames.

The other options are not sources that WPA3-Personal uses to generate a different PMK each time a station connects to the wireless network because:

Opportunistic Wireless Encryption (OWE): OWE is a feature that provides encryption for open networks without requiring authentication or passwords. OWE uses a similar key establishment protocol as SAE, but it does not generate a PMK. Instead, it generates a Pairwise Secret (PS) that is used as an input for the 4-way handshake that generates the PTK.

Simultaneous Authentication of Equals (SAE): SAE is not a source, but a protocol that uses session-specific information as a source to generate a different PMK each time a station connects to the wireless network.

Key Encryption Key (KEK): KEK is not a source, but an output of the 4-way handshake that generates the PTK. KEK is used to encrypt group keys that are distributed by the access point.
