Our ISA-IEC-62443 study materials include 3 versions and they are the PDF version, PC version, APP online version. You can understand each version's merits and using method in detail before you decide to buy our ISA-IEC-62443 study materials. For instance, PC version of our ISA-IEC-62443 training quiz is suitable for the computers with the Windows system and supports the MS Operation System. It is a software application which can be installed and it stimulates the real exam's environment and atmosphere. It builds the users' confidence and the users can practice and learn our ISA-IEC-62443 learning guide at any time.

### ISA/IEC 62443 Cybersecurity Fundamentals Specialist Sample Questions (Q115-Q120):

#### NEW QUESTION # 115

What is the name of the protocol that implements serial Modbus over Ethernet?

Available Choices (select all choices that are correct)

- **A. MODBUS/TCP**
- B. MODBUS/CIP
- C. MODBUS/Plus
- D. MODBUS/Ethernet

**Answer: A**

Explanation:

MODBUS/TCP is the name of the protocol that implements serial Modbus over Ethernet. MODBUS/TCP is a variant of the Modbus protocol that uses the Transmission Control Protocol (TCP) as the transport layer to encapsulate Modbus messages and send them over Ethernet networks. MODBUS/TCP preserves the Modbus application layer and data model, which means that serial Modbus devices can communicate with MODBUS

/TCP devices through a gateway or a converter. MODBUS/TCP is widely used in industrial automation and control systems, as it offers high performance, interoperability, and compatibility with existing Modbus devices. #### NEW QUESTION # 116

A manufacturing plant wants to improve its risk management by categorizing all equipment and tracking their status and relationships. Which framework should it implement?

- **A. Asset models**
- B. Conduits
- C. Reference architecture
- D. Security zones

**Answer: A**

Explanation:

An asset model is a structured framework used to catalog, categorize, and manage assets in an industrial control environment. It allows organizations to track the status, relationships, and criticality of equipment, supporting effective risk management and security planning.

"Asset models define the components of the system and their interrelationships to support activities such as risk analysis, security monitoring, and maintenance."

- ISA/IEC 62443-1-1:2007, Clause 4.3 - Asset and Component Modeling

In contrast:

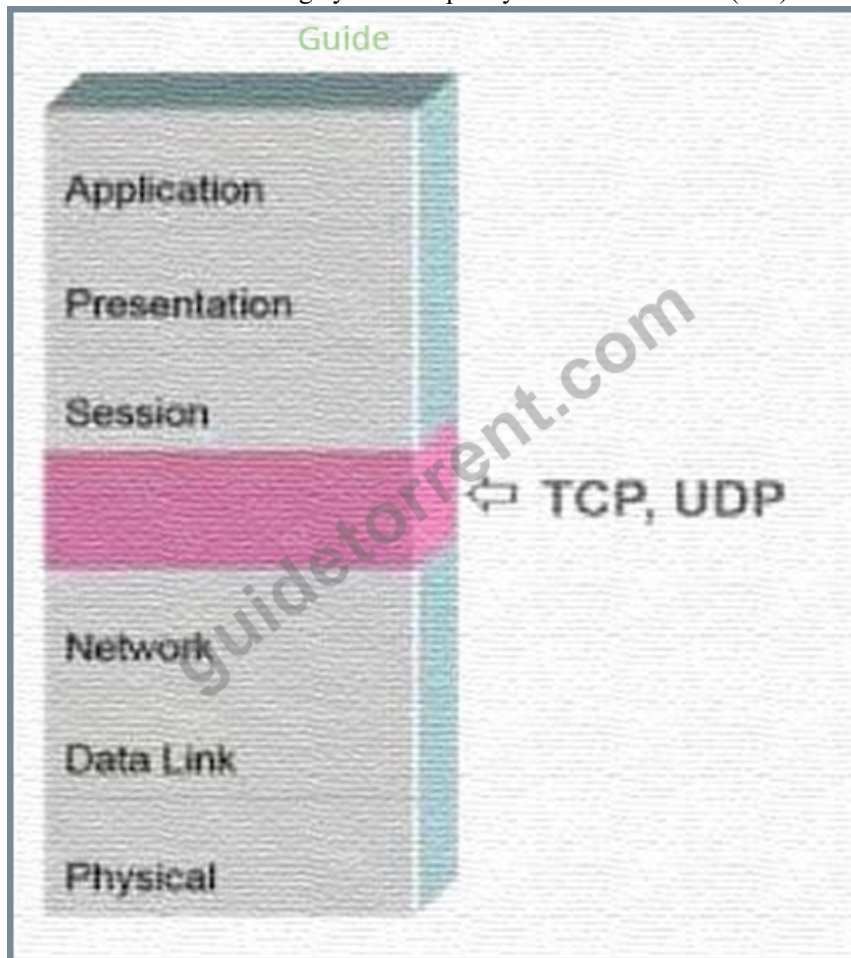

Conduits represent communication paths between zones

Security zones group assets by security requirements

Reference architectures are templates for system design-not for tracking assets References:

**NEW QUESTION # 117**

What is the name of the missing layer in the Open Systems Interconnection (OSI) model shown below?

- A. Protocol
- B. Control
- C. User
- **D. Transport**

**Answer: D**

Explanation:

The Open Systems Interconnection (OSI) model is a framework that describes the functions of a networking system. The OSI model categorizes the computing functions of the different network components, outlining the rules and requirement needed to support the interoperability of the software and hardware that make up the network<sup>1</sup>.

The OSI model consists of seven abstraction layers arranged in a top-down order: Physical, Data Link, Network, Transport, Session, Presentation, and Application. The Transport layer is the fourth layer in the OSI model, and it is responsible for ensuring reliable and efficient data transfer between the Network layer and the Session layer<sup>2</sup>. The Transport layer uses protocols such as Transmission Control Protocol (TCP) and User Datagram Protocol (UDP) to provide end-to-end communication services, such as error detection and correction, flow control, congestion control, and segmentation<sup>2</sup>.

The image that you sent shows a 3D representation of the OSI model, with the layers stacked on top of each other. The missing layer is the Transport layer, which is represented by a pink box with a white arrow pointing to it. The arrow is labeled "TCP, UDP".

**NEW QUESTION # 118**

What is one challenge associated with firewalls?

- A. Deciding how they should be configured
- B. Difficulty of installation
- C. That they can only filter HTTP traffic
- D. Need for constant updates

**Answer: A**

Explanation:

A significant challenge with firewalls in industrial environments is deciding how they should be configured.

The complexity arises from needing to balance operational requirements (such as process data flow) with security needs (such as blocking unauthorized access). Misconfiguration can lead either to security gaps or to unnecessary operational disruptions. Firewalls can filter many types of traffic (not just HTTP) and while updates are important, configuration is the biggest ongoing challenge.

Reference: ISA/IEC 62443-3-3:2013, Section 4.2.3.3 (Firewalls and configuration management); ISA/IEC 62443-2-1:2009, Section 6.3.2.

### NEW QUESTION # 119

Which layer specifies the rules for Modbus Application Protocol

Available Choices (select all choices that are correct)

- A. Presentation layer
- B. Session layer
- C. Application layer
- D. Data link layer

**Answer: C**

Explanation:

The Modbus Application Protocol is a messaging protocol that provides client/server communication between devices connected on different types of buses or networks. It is positioned at level 7 of the OSI model, which is the application layer. The application layer is the highest level of the OSI model and defines the rules and formats for data exchange between applications. The Modbus Application Protocol is independent of the underlying communication layers and can be implemented using different transport protocols, such as TCP/IP, serial, or Modbus Plus. The Modbus Application Protocol defines the function codes, data formats, and error codes for Modbus transactions. References:
