ExamDumpsVCE experts have also developed Splunk O11y Cloud Certified Metrics User (SPLK-4001) test simulation software for you to assess and improve yourself. This is especially useful for intensive preparation and revision. It will provide you with an Splunk O11y Cloud Certified Metrics User (SPLK-4001) exam environment and will give you real exam Splunk SPLK-4001 questions.

The Splunk O11y Cloud Certified Metrics User certification exam tests an individual's knowledge of the Observability Cloud and its features, including metrics collection, analysis, and visualization. SPLK-4001 exam also covers topics such as creating dashboards and alerts, working with time series data, and troubleshooting common issues. SPLK-4001 Exam is designed to ensure that candidates have a deep understanding of the platform and can use it effectively to monitor and analyze metrics data.

100% Pass-Rate Splunk SPLK-4001 Latest Test Materials offer you accurate Valid Mock Exam | Splunk O11y Cloud Certified Metrics User

The top Splunk SPLK-4001 certification benefits are proven skills, more career opportunities, an increase in salary, instant

promotion, and membership in professional community groups. Surely all these SPLK-4001 certification benefits are immediately available after passing the Splunk SPLK-4001 Certification Exam. To do this you just need to pass the SPLK-4001 certification exam which is not easy to pass.

Splunk SPLK-4001 certification exam is a globally recognized certification program that demonstrates the candidate's mastery in using Splunk's O11y Cloud platform to monitor and analyze metrics. Splunk O11y Cloud Certified Metrics User certification is recognized by industry experts and employers, providing candidates with a competitive edge in the job market. Splunk O11y Cloud Certified Metrics User certification program also provides candidates with access to Splunk's community of experts, resources, and tools, enabling them to stay up-to-date with the latest trends and best practices in using Splunk's O11y Cloud platform.

The Splunk SPLK-4001 Exam consists of 65 questions that are to be completed in 90 minutes. The questions are in a multiple-choice format with a passing score of 70% or higher. Splunk O11y Cloud Certified Metrics User certification is valid for two years and must be renewed after the expiration date. There is a registration fee to take the exam, and the exam can be taken at any Pearson VUE test center or online through remote proctoring. Splunk O11y Cloud Certified Metrics User certification exam requires thorough preparation, including self-study, practice tests, and attending Splunk training courses.

Splunk O11y Cloud Certified Metrics User Sample Questions (Q57-Q62):

NEW QUESTION # 57

A customer is experiencing an issue where their detector is not sending email notifications but is generating alerts within the Splunk Observability UI. Which of the below is the root cause?

- A. The detector has an incorrect signal,
- B. The detector has an incorrect alert rule.
- C. The detector has a muting rule.
- D. The detector is disabled.

Answer: C

Explanation:

The most likely root cause of the issue is D. The detector has a muting rule.

A muting rule is a way to temporarily stop a detector from sending notifications for certain alerts, without disabling the detector or changing its alert conditions. A muting rule can be useful when you want to avoid alert noise during planned maintenance, testing, or other situations where you expect the metrics to deviate from normal. When a detector has a muting rule, it will still generate alerts within the Splunk Observability UI, but it will not send email notifications or any other types of notifications that you have configured for the detector. You can see if a detector has a muting rule by looking at the Muting Rules tab on the detector page. You can also create, edit, or delete muting rules from there. To learn more about how to use muting rules in Splunk Observability Cloud, you can refer to this documentation.

NEW QUESTION # 58

In the Splunk distribution of the OpenTelemetry Collector, what is the difference between the `agent_config.yaml` and the `splunk-otel-collector.conf` files?

- A. `splunk-otel-collector.conf` configures processors and `agent_config.yaml` sets the memory limits for the collector.
- B. `agent_config.yaml` defines the OpenTelemetry pipeline, and `splunk-otel-collector.conf` sets endpoint URLs and access tokens.
- C. `splunk-otel-collector.conf` defines the OpenTelemetry pipeline, and `agent_config.yaml` sets endpoint URLs and access tokens.
- D. `agent_config.yaml` configures the gateway's address and `splunk-otel-collector.conf` sets the memory limits for the collector.

Answer: C

NEW QUESTION # 59

Which of the following are correct ports for the specified components in the OpenTelemetry Collector?

- A. gRPC (4000), SignalFx (9943), Fluentd (6060)
- B. gRPC (6831), SignalFx (4317), Fluentd (9080)
- C. gRPC (4317), SignalFx (9080), Fluentd (8006)
- D. gRPC (4459), SignalFx (9166), Fluentd (8956)

Answer: C

Explanation:

The correct answer is D. gRPC (4317), SignalFx (9080), Fluentd (8006).

According to the web search results, these are the default ports for the corresponding components in the OpenTelemetry Collector. You can verify this by looking at the table of exposed ports and endpoints in the first result¹. You can also see the agent and gateway configuration files in the same result for more details.

NEW QUESTION # 60

A customer is experiencing issues getting metrics from a new receiver they have configured in the OpenTelemetry Collector. How would the customer go about troubleshooting further with the logging exporter?

- A. Adding debug into the metrics receiver pipeline:
☐
- **B. Adding logging into the metrics receiver pipeline:**
☐
- C. Adding logging into the metrics exporter pipeline:
☐
- D. Adding debug into the metrics exporter pipeline:
☐

Answer: B

Explanation:

Explanation

The correct answer is B. Adding logging into the metrics receiver pipeline.

The logging exporter is a component that allows the OpenTelemetry Collector to send traces, metrics, and logs directly to the console. It can be used to diagnose and troubleshoot issues with telemetry received and processed by the Collector, or to obtain samples for other purposes¹. To activate the logging exporter, you need to add it to the pipeline that you want to diagnose. In this case, since you are experiencing issues with a new receiver for metrics, you need to add the logging exporter to the metrics receiver pipeline. This will create a new plot that shows the metrics received by the Collector and any errors or warnings that might occur¹. The image that you have sent with your question shows how to add the logging exporter to the metrics receiver pipeline. You can see that the exporters section of the metrics pipeline includes logging as one of the options.

This means that the metrics received by any of the receivers listed in the receivers section will be sent to the logging exporter as well as to any other exporters listed². To learn more about how to use the logging exporter in Splunk Observability Cloud, you can refer to this documentation¹.

1: <https://docs.splunk.com/Observability/gdi/opentelemetry/components/logging-exporter.html> 2:

NEW QUESTION # 61

When installing OpenTelemetry Collector, which error message is indicative that there is a misconfigured realm or access token?

- A. 404 (NOT FOUND)
- **B. 401 (UNAUTHORIZED)**
- C. 503 (SERVICE UNREACHABLE)
- D. 403 (NOT ALLOWED)

Answer: B

Explanation:

Explanation

The correct answer is C. 401 (UNAUTHORIZED).

According to the web search results, a 401 (UNAUTHORIZED) error message is indicative that there is a misconfigured realm or access token when installing OpenTelemetry Collector¹. A 401 (UNAUTHORIZED) error message means that the request was not authorized by the server due to invalid credentials. A realm is a parameter that specifies the scope of protection for a resource, such as a Splunk Observability Cloud endpoint.

An access token is a credential that grants access to a resource, such as a Splunk Observability Cloud API. If the realm or the access token is misconfigured, the request to install OpenTelemetry Collector will be rejected by the server with a 401

Option A is incorrect because a 403 (NOT ALLOWED) error message is not indicative that there is a misconfigured realm or access token when installing OpenTelemetry Collector. A 403 (NOT ALLOWED) error message means that the request was authorized by the server but not allowed due to insufficient permissions. Option B is incorrect because a 404 (NOT FOUND) error message is not indicative that there is a misconfigured realm or access token when installing OpenTelemetry Collector. A 404 (NOT FOUND) error message means that the request was not found by the server due to an invalid URL or resource. Option D is incorrect because a 503 (SERVICE UNREACHABLE) error message is not indicative that there is a misconfigured realm or access token when installing OpenTelemetry Collector. A 503 (SERVICE UNREACHABLE) error message means that the server was unable to handle the request due to temporary overload or maintenance.
