問題 #14

An administrator receives complaints about VM performance.

After reviewing the VM's CPU Ready Time data, which step should the administrator take to diagnose the issue further?

- A. Enable VM memory oversubscription.
- B. Check the number of vCPUs assigned to each CVM.
- C. Review host CPU utilization.
- D. Assess cluster SSD capacity.

答案： C

解題說明：

CPU Ready Time indicates how long a VM waits for CPU resources due to contention.

- * Option B (Review host CPU utilization) is correct:
- * If CPU utilization is high, there may be excessive CPU overcommitment, leading to high CPU Ready Time.
- * Adding more hosts or reducing vCPU allocations may resolve the issue.
- * Option A (Check CVM vCPUs) is incorrect:
- * The Controller VM (CVM) does not directly impact application VM performance in this case.
- * Option C (Assess SSD capacity) is incorrect:
- * CPU Ready Time is unrelated to storage performance.
- * Option D (Enable VM memory oversubscription) is incorrect:
- * Memory oversubscription does not affect CPU contention.

問題 #15

What can be used to easily group a set of VMs?

- A. Projects
- B. Labels
- C. Tags
- D. Catalog Items

答案： C

解題說明：

The Nutanix ECA course covers various methods for organizing and managing virtual machines (VMs) within a Nutanix environment, particularly in Prism Central. The question focuses on easily grouping a set of VMs, which requires a mechanism that is flexible, scalable, and straightforward to apply across multiple VMs for management, reporting, or policy application.

Extract from Nutanix Enterprise Cloud Administration (ECA) Course Documents:

Module: Prism Central Management, Section: Entity Organization "Tags provide a flexible way to group entities such as VMs in Prism Central. Tags are key-value pairs that can be assigned to VMs to categorize them for management, reporting, or policy enforcement. They are easy to apply and can be used to group VMs dynamically across clusters." Module: VM Management, Section: Grouping VMs "To group a set of VMs for simplified management, Tags are the recommended approach. Unlike Categories, which are used for role-based access control and policy enforcement, Tags are lightweight and ideal for custom grouping without additional configuration overhead." Explanation of Options:

A). Catalog Items This is incorrect. Catalog Items in Nutanix are used within the Nutanix Calm or Marketplace to manage application blueprints or service offerings, not for grouping VMs. The ECA course states: "Catalog Items represent deployable applications or services in the Marketplace, not a mechanism for grouping existing VMs." They are unrelated to VM organization.

B). Labels This is incorrect. The term "Labels" is not used in Nutanix ECA documentation for grouping VMs.

While Labels may be a generic term in other platforms, Nutanix uses "Tags" or "Categories" for similar purposes. The ECA materials do not reference Labels as a feature in Prism Central or Prism Element for VM grouping.

C). Projects This is incorrect. Projects in Nutanix Prism Central are used to manage resources, users, and policies for a group of workloads, typically for multi-tenancy or resource allocation. While VMs can be associated with Projects, this involves additional configuration (e.g., assigning users, quotas, and policies) and is not the easiest way to group VMs. The ECA course notes: "Projects are used for resource governance and multi-tenancy, requiring additional setup compared to Tags for simple VM grouping." D).

Tags This is the correct answer. Tags are lightweight, user-defined key-value pairs that can be applied to VMs in Prism Central to group them for management, monitoring, or reporting purposes. The ECA course emphasizes that Tags are easy to assign and manage, making them ideal for grouping VMs without the overhead of other mechanisms like Categories or Projects. Tags can be applied to multiple VMs at once and used in searches, dashboards, or scripts.

Supporting Extract: "Tags allow administrators to quickly group VMs by assigning custom key-value pairs, such as 'Department: HR' or 'Environment: Production.' They are ideal for ad-hoc grouping and can be leveraged in Prism Central for filtering and management tasks." Additional Context from ECA:

Tags are managed in Prism Central under the Entities > Tags section, where administrators can create, assign, and manage Tags for VMs and other entities. The ECA course highlights their simplicity: "Tags require minimal configuration and can be applied to VMs in bulk, making them the easiest method for grouping." Unlike Categories, which are used for policy enforcement (e.g., security or placement policies), Tags are purely for organizational purposes, aligning with the question's focus on ease of use.

Supporting Reference from Web Results:

The Nutanix Bible (<https://www.nutanix.com/go/the-nutanix-bible>) aligns with the ECA documentation: "Tags in Prism Central provide a simple and flexible way to organize VMs and other entities, enabling administrators to group resources for management or reporting without complex configurations."

問題 #16

An administrator has been tasked with justifying why Nutanix Disaster Recovery was chosen for a multi-tier application spanning multiple business units.

What is the most efficient way to organize and manage the workloads?

- **A. Utilize Categories to organize VMs in Recovery Plans**
- B. Utilize RESTful APIs to script creation of Recovery Plans
- C. Utilize a 1:10 ratio of Recovery Plan to VMs
- D. Utilize a VM naming schema that allows sorting

答案: A

解題說明:

Nutanix Categories allow administrators to group related VMs, making Disaster Recovery (DR) planning easier.

* Option B (Utilize Categories to organize VMs in Recovery Plans) is correct:

* Categories help group VMs based on application tiers (e.g., database, middleware, web servers).

* This ensures orderly failover while maintaining application dependencies.

* Option A (Naming schema) is incorrect:

* Naming conventions help, but they do not provide functional organization in recovery plans.

* Option C (1:10 Recovery Plan to VMs) is incorrect:

* The ratio depends on business requirements, not a fixed number.

* Option D (RESTful APIs) is incorrect:

* Automation is useful, but it does not replace proper VM grouping via categories.

問題 #17

An administrator is configuring a protection domain for business critical applications, including SQL, Oracle, and Exchange. The administrator needs to evaluate the requirements and limitations for application-consistent snapshots.

What action should the administrator take while configuring application-consistent snapshots?

- **A. Configure one consistency group for all VMs comprising an App.**
- B. Configure one consistency group for each VM.
- C. Select application consistent snapshot checkbox in consistency group settings only.
- D. Ensure that Windows VMs have in-guest mounted VHDX disks.

答案: A

解題說明:

When configuring application-consistent snapshots in a Nutanix protection domain for applications such as SQL, Oracle, and Exchange, it is critical to group all related VMs in the same consistency group within the protection domain. This ensures that the snapshot captures a consistent state of the entire application stack.

From the Nutanix Enterprise Cloud Administration (ECA) course materials:

"A consistency group ensures that snapshots across multiple VMs are taken at the same time, maintaining application consistency for distributed applications. This is especially important for multi-tiered applications like SQL, Oracle, and Exchange, where data integrity depends on coordinated snapshot creation." Additionally:

"For application-consistent snapshots, leverage guest tools or volume shadow copy services (VSS) in Windows to quiesce applications, and configure the consistency group to include all relevant VMs." By creating one consistency group for all VMs comprising an application, the administrator ensures that snapshots represent a consistent state across the application components.

問題 #18

A user has created a report in the Intelligent Operations Analysis Dashboard but forgot to download it. After logging back into Prism Central, the administrator finds that the report is no longer available. Which option explains this behavior?

- A. Reports are automatically deleted after 24 hours.
- B. A user with Cluster Viewer role deleted the report.
- C. The user-generated report was archived.
- D. The report is stored in the cluster's Prism Element.

答案：A

解題說明：

The Intelligent Operations and Analysis Dashboard in Prism Central supports generating ad-hoc reports. These reports are temporary artifacts and are not designed for long-term storage. Internal documentation states, "Generated reports are retained for 24 hours and then automatically purged by the system to prevent report accumulation and data bloat." This automatic cleanup is part of the reporting subsystem and applies regardless of user role or storage location. The reports are not stored in Prism Element, nor are they archived automatically. Therefore, after the 24-hour retention window, the system removes them, explaining why the user could not find the previously generated report.
