When a Marvis Action is shown as "AI Validated", it means that Marvis has observed an issue that is no longer present.

NEW QUESTION # 90
At which signal strength level range will an extra AP placed on the same channel cause co-channel contention?

- A. -45 dBm to -65 dBm
- B. -55 dBm to -80 dBm
- C. -65 dBm to -85 dBm
- D. -25 dBm to -80 dBm

Answer: A

Explanation:
In the context of Juniper Mist AI and high-performance wireless design,Co-Channel Contention (CCC)- often referred to as Co-Channel Interference (CCI)-occurs when two or more access points (APs) share the same frequency channel and are within "hearing" distance of one another.1The key to understanding this specific range lies in the802.11 CSMA/CAmechanism, specifically theClear Channel Assessment (CCA) process.
When a Mist AP or a client device wants to transmit, it first performs a CCA. If it detects a Wi-Fi preamble from another device on the same channel at a signal strength above theSignal Detect (SD)threshold (typically around -82 to -85 dBm for many radios,

though performance drops much sooner), it must defer its transmission. However, for "contention" to become a significant performance bottleneck that triggers Mist SLE alerts, the signal strength usually falls within the-45 dBm to -65 dBmrange.
In this range, the signals are strong enough that the APs are effectively "in the same room" or nearby rooms, meaning they will constantly see the medium as "busy" whenever the other AP is transmitting. This effectively merges the two APs into a single contention domain, forcing them to share the total available airtime. For example, if two APs on the same channel both see each other at -60 dBm, they cannot transmit simultaneously; instead, they must take turns.
Mist'sRadio Resource Management (RRM)and theCapacity SLEspecifically monitor for these overlapping BSS (OBSS) conditions. If the AI detects that an AP is seeing a neighbor on the same channel at these high signal levels, it will attempt to change the channel or reduce transmit power to "shrink" the cell size, aiming to push the neighbor's signal strength below the point where it causes constant deferrals, thereby improving the overall capacity and user experience for the site.

NEW QUESTION # 91
What information is required to initially claim an AP and assign it to a Mist organization?

- A. The AP's MAC address and a password set on the AP.
- B. The AP's serial number and its IP address.
- C. The AP's MAC address and the Claim Code from the packaging.
- D. The AP's model number and the site name.

Answer: C
