VMware vDefend Security for VCF 5.x Administrator Sample Questions (Q15-Q20):

NEW QUESTION # 15

Which two practices are recommended when designing lateral protection strategies for segmented workloads?

(Choose two)

Response:

- A. Disable DFW logging for compliance
- B. Use DNS names in all firewall rules
- C. Allow all intra-cluster traffic for performance
- **D. Define granular security policies per application tier**
- **E. Leverage security groups and dynamic membership**

Answer: D,E

NEW QUESTION # 16

Which of the following represent operational inefficiencies for application owners when it comes to security implementation? (Select all that apply)

- **A. Lack of communication between infrastructure and application teams**
- B. Lack of visibility in hybrid cloud environments
- **C. Lack of application awareness for network-based security policies**
- **D. Lack of automation across tools and platforms**

Answer: A,C,D

Explanation:

In modern data centers, implementing micro-segmentation often fails due to operational silos and inefficiencies rather than technology limitations. Application owners typically struggle with a lack of automation across disjointed security tools (Option B), a historical lack of communication between the infrastructure/network teams and the application developers (Option C), and traditional network-based security policies (like IP addresses and VLANs) that lack contextual awareness of the actual applications they are protecting (Option D). vDefend Security Intelligence is designed specifically to solve these exact inefficiencies by providing deep application visibility and automated rule recommendations.

NEW QUESTION # 17

vDefend Malware Detection can be enforced on which of the following? (Select all that apply)

- A. T1 Service Interfaces
- **B. T1 Downlinks**
- **C. T1 Uplinks**
- D. T0 Downlinks

Answer: B,C

Explanation:

While Malware Prevention is heavily utilized at the Distributed (vNIC) level, it can also be deployed as Gateway Malware Prevention to secure perimeter boundaries.

In the vDefend architecture, Gateway Malware Prevention is explicitly designed to be attached to the Tier-1 (T1) Gateways. By applying the enforcement profile to the T1 Uplinks (traffic leaving the tenant zone towards the main data center/internet) and the T1 Downlinks (traffic moving between the gateway and the internal application segments), you can successfully intercept and extract files crossing your tenant or application zone perimeters for deep sandbox analysis.

NEW QUESTION # 18

Which following roles are pre-configured in roles and cannot be modified? (Select all that apply)

- A. Principal Identity Users
- B. Local Users
- C. External Users
- D. Admin
- E. Audit
- F. Guest Users
- G. Analyst

Answer: D,E

Explanation:

In VMware vDefend (NSX), Role-Based Access Control (RBAC) is foundational for securing the management plane and ensuring that users only have the permissions necessary to perform their jobs (the principle of least privilege). The system ships with several built-in roles out-of-the-box.

The Admin (often referred to as Enterprise Admin) and Audit roles are hardcoded, immutable system roles. They are pre-configured to ensure there is always a guaranteed, tamper-proof baseline for system administration and compliance auditing.

The Admin Role: This is the highest level of privilege in the system. It grants full read and write access to every configuration, policy, and system setting within the vDefend environment. Broadcom locks this role to prevent accidental demotion or modification that could potentially lock legitimate administrators out of the system or break underlying integrations (like vCenter or VCF).

The Audit Role: This is a strict read-only role designed exclusively for compliance officers and security auditors. It allows a user to view configurations, logs, and security policies without any ability to make changes. This role is immutable to guarantee to compliance regulatory bodies that the auditor has unimpeded, read-only visibility that cannot be silently modified or restricted by a rogue administrator.

NEW QUESTION # 19

Which two sources of data are used by NSX for NTA/NDR analytics?

(Choose two)

Response:

- A. vSAN replication logs
- B. Flow telemetry from virtual switches
- C. Distributed Resource Scheduler logs
- D. BIOS-level hardware alerts
- E. Threat intelligence feeds

Answer: B,E
