Do you want to find a high efficiency way to prepare for CAS-005 exam test? As we all know, high efficiency will produce unbelievable benefits. With our CompTIA CAS-005 study pdf, you can make full use of your spare time. If you are tired of screen reading, you can print CAS-005 Pdf Dumps into papers. You take your spare time to prepare and study. You will get your CAS-005 exam certification with less time investment. Come on, everyone, Choose CAS-005 test dumps, you will succeed.

CompTIA CAS-005 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Security Engineering: This section measures the skills of CompTIA security architects that involve troubleshooting common issues related to identity and access management (IAM) components within an enterprise environment. Candidates will analyze requirements to enhance endpoint and server security while implementing hardware security technologies. This domain also emphasizes the importance of advanced cryptographic concepts in securing systems.
Topic 2	<ul style="list-style-type: none"> Security Operations: This domain is designed for CompTIA security architects and covers analyzing data to support monitoring and response activities, as well as assessing vulnerabilities and recommending solutions to reduce attack surfaces. Candidates will apply threat-hunting techniques and utilize threat intelligence concepts to enhance operational security.
Topic 3	<ul style="list-style-type: none"> Governance, Risk, and Compliance: This section of the exam measures the skills of CompTIA security architects that cover the implementation of governance components based on organizational security requirements, including developing policies, procedures, and standards. Candidates will learn about managing security programs, including awareness training on phishing and social engineering.
Topic 4	<ul style="list-style-type: none"> Security Architecture: This domain focuses on analyzing requirements to design resilient systems, including the configuration of firewalls and intrusion detection systems.

CompTIA SecurityX Certification Exam Sample Questions (Q147-Q152):

NEW QUESTION # 147

A company SIEM collects information about the log sources. Given the following report information:

Device	Type	Time	Status	Function
VM001	Server	10:23:241	UP	Critical
VM002	Server	10:22:323	UP	Normal
NET002	Router	10:23:391	UP	Normal
NET003	IPS	10:45:312	DOWN	Normal
VM003	Server	9:53:783	DOWN	Critical

Which of the following actions should a security engineer take to enhance the security monitoring posture?

- A. Implement a centralized use case library to get alerts based on the type of log sources.
- B. Calibrate the timing on the log sources to enhance event correlation.
- C. Perform a non-reporting device assessment to collect missing log sources.
- D. Create a resiliency plan to prevent losing event logs from log sources.

Answer: C

Explanation:

The SIEM report shows that some devices, such as VM003 (Critical server) and NET003 (IPS), are DOWN and therefore not reporting logs. In security monitoring, the absence of log data from critical systems creates dangerous blind spots. If logs are missing, attacks can proceed undetected, or investigations may lack the data needed for incident response.

The most effective action is to perform a non-reporting device assessment (C). This means identifying and correcting issues where devices fail to send logs, whether due to outages, misconfigurations, or integration gaps. Ensuring all critical devices, especially servers and intrusion prevention systems, consistently send logs to the SIEM strengthens overall visibility and monitoring posture.

Option A (time calibration) is important for correlation accuracy but does not address missing log feeds.

Option B (centralized use case library) enhances detection but only works if the SIEM is receiving complete data. Option D (resiliency plan) helps protect log retention but is irrelevant if logs are never received in the first place.

Therefore, fixing non-reporting log sources is the highest priority to improve monitoring effectiveness.

NEW QUESTION # 148

Which of the following tests explains why AI output could be inaccurate?

- A. Model poisoning
- B. Social engineering
- C. Output handling
- D. Prompt injections

Answer: A

Explanation:

Comprehensive and Detailed

Model poisoning occurs when an attacker manipulates the training data or the training process of an AI model so that its predictions are deliberately inaccurate or biased. In the SecurityX CAS-005 objectives, this is part of understanding emerging technology threats, specifically AI/ML vulnerabilities. This differs from:

Social engineering, which manipulates humans rather than AI models.

Output handling, which deals with how outputs are processed but doesn't cause inaccuracy at the model level.

NEW QUESTION # 149

A software engineer is creating a CI/CD pipeline to support the development of a web application. The DevSecOps team is required to identify syntax errors. Which of the following is the most relevant to the DevSecOps team's task?

- A. Web application vulnerability scanning
- **B. Static application security testing**
- C. Software composition analysis
- D. Runtime application self-protection

Answer: B

Explanation:

Static Application Security Testing (SAST) involves analyzing source code or compiled code for security vulnerabilities without executing the program. This method is well-suited for identifying syntax errors, coding standards violations, and potential security issues early in the development lifecycle.

A: Static application security testing (SAST): SAST tools analyze the source code to detect syntax errors, vulnerabilities, and other issues before the code is run. This is the most relevant task for the DevSecOps team to identify syntax errors and improve code quality.

B: Software composition analysis: This focuses on identifying vulnerabilities in open-source components and libraries used in the application but does not address syntax errors directly.

C: Runtime application self-protection (RASP): RASP involves monitoring and protecting applications during runtime, which does not help in identifying syntax errors during the development phase.

D: Web application vulnerability scanning: This involves scanning the running application for vulnerabilities but does not address syntax errors in the code.

NEW QUESTION # 150

An organization recently implemented a purchasing freeze that has impacted endpoint life-cycle management efforts. Which of the following should a security manager do to reduce risk without replacing the endpoints?

- A. Deploy EDR
- **B. Remove unneeded services**
- C. Reimage the system
- D. Dispose of end-of-support devices

Answer: B

NEW QUESTION # 151

An engineer has had scaling issues with a web application hosted on premises and would like to move to a serverless architecture. Which of the following cloud benefits would be best to utilize for this project?

- A. Eliminating need to patch
- B. Providing geo-redundant hosting
- **C. Automation of resource provisioning**
- D. Cost savings for hosting

Answer: C

Explanation:

The best cloud benefit for moving to a serverless architecture in this case is Automation of resource provisioning. Serverless

computing automatically scales resources based on demand without requiring manual intervention. This helps to address the scaling issues the engineer is facing by dynamically adjusting resource allocation as needed, improving performance and efficiency without manual effort.
