## Premium Archer-Expert Files, Archer-Expert Latest Exam Vce

The Archer Archer-Expert PDF questions file of VCEEngine has real Archer Archer-Expert exam questions with accurate answers. You can download Archer PDF Questions file and revise Archer Certified Administrator-Expert Archer-Expert exam questions from any place at any time. We also offer desktop Archer-Expert practice exam software which works after installation on Windows computers. The Archer-Expert web-based practice test on the other hand needs no software installation or additional plugins. Chrome, Opera, Microsoft Edge, Internet Explorer, Firefox, and Safari support the web-based Archer-Expert Practice Exam. You can access the Archer Archer-Expert web-based practice test via Mac, Linux, iOS, Android, and Windows. Archer Certified Administrator-Expert Archer-Expert practice test (desktop & web-based) allows you to design your mock test sessions.

## Archer Certified Administrator-Expert Sample Questions (Q52-Q57):

### NEW QUESTION # 52

What happens if an Administrator runs a Data Import source file that contains a value for a Values List field that is not an existing value?

- A. The new value will be added to the record and appended to the Values List field values available for selection.
- **B. The Data Import fails unless this new value is appended to the values available for selection.**
- C. The Data Import will process and this value will be discarded.
- D. The new value will be added to the record only with no change to the Values List field values.

**Answer: B**

Explanation:

In Archer, Values List fields are strictly validated against the pre-defined options in the field configuration.

During a manual Data Import , if the source file contains a value that does not exactly match an existing entry in the Values List, the import for that specific record (or the entire process, depending on settings) will fail.

According to the Archer Administration II guide, for the import to succeed with new data, the administrator must first enable the "Create new values for Values List fields" option in the Data Import settings. If this is not enabled, Archer treats the unknown value as an error. This is a critical data integrity feature that prevents

"dirty data" from entering the system. Unlike a Data Feed, which has more advanced "lookup" and "creation" logic, the Data Import tool is less flexible by default to ensure administrators are consciously deciding whether to expand the application's metadata.

**NEW QUESTION # 53**

Where are LDAP-related errors logged?

- A. Data Feed Service log file
- **B. Job framework log file**
- C. Configuration service log file
- D. Queuing service log file

**Answer: B**

Explanation:

LDAP Synchronization is an asynchronous task managed by the Archer Job Engine . According to the Archer Installation and Troubleshooting guide, all tasks that are processed by the background Job Engine- including Recalculations, Notifications, and LDAP Syncs-capture their detailed execution data and error stack traces in the Job Framework log files .

These logs are typically found on the Services server in the \Logs directory (e.g., Archer.JobFramework.log).

When an LDAP sync fails (perhaps due to a service account lockout or a network timeout reaching the Domain Controller), the error will not appear in the Configuration Service (Option D), which only handles ACP settings, nor the Queuing Service (Option C), which only manages the "hand-off" of tasks. The Job Framework log is the granular technical record that administrators must consult to identify the specific LDAP error codes (like "52e" for invalid credentials) returned by the directory server.

**NEW QUESTION # 54**

What is the main difference between an environment and an instance in Archer?

- A. An environment and an instance are the same.
- B. An environment is a single system, and an instance is a collection of systems.
- C. An instance can host multiple environments.
- **D. An environment can host multiple instances, and each instance has its own database and file repository.**

**Answer: D**

Explanation:

Understanding the Archer hierarchy is fundamental to system administration. As detailed in the Archer Administration II curriculum and the Archer Control Panel (ACP) guides, an Environment refers to the overall installation of the Archer software on a set of servers (Web, Services, and Database).

Within a single environment, an administrator can host multiple Instances . Each instance represents a logically isolated "tenant" with its own unique Instance Database , File Repository (for attachments), and set of users. For example, an organization might have one environment that hosts a "Production" instance, a "UAT" instance, and a "Training" instance. This architecture allows organizations to share the same server hardware and software binaries while keeping the data and configurations of different business units or development stages completely separate and secure from one another.

**NEW QUESTION # 55**

Which statement is NOT true for the Archer APIs?

- A. The Content API can use XML for the API request and response.
- +1

- B. The RESTful API can use XML for the API request and response.
- **C. The SOAP API can use JSON for the API request and response.**
- D. The RESTful API can use JSON for the API request and response.

**Answer: C**

Explanation:

According to the Archer API Guide and Administration II materials, the Archer APIs have specific formatting requirements based on their architecture. The SOAP API (Simple Object Access Protocol) is strictly bound to the XML-based SOAP protocol. It uses a Web Services Description Language (WSDL) to define the structure of its messages, and these messages must be formatted as XML. It cannot process or return JSON payloads.

In contrast, the RESTful API is more flexible; while it defaults to JSON for modern integrations, it is capable of supporting both XML and JSON depending on the "Content-Type" and "Accept" headers provided in the request. The Content API, which is a specific subset of the Archer RESTful infrastructure, also follows these multi-format capabilities. Therefore, the statement that the SOAP API can use JSON is the incorrect one. For administrators building integrations, understanding this distinction is vital, as modern web applications typically prefer JSON, but legacy Archer SOAP services will reject any request that is not valid XML.

#### NEW QUESTION # 56

What action should never be completed using the Advanced Workflow Job Troubleshooting tool?

- **A. Editing the Advanced Workflow.**
- B. Manually moving a record to the next node.
- C. Restarting a job.
- D. Canceling a job.

**Answer: A**

Explanation:

The Advanced Workflow Job Troubleshooting tool is a runtime utility designed to manage individual "instances" of records currently enrolled in a workflow. It is used to fix records that are stuck due to errors.

According to the Advanced Workflow Beyond the Basics guide, this tool is purely for operational maintenance (Cancel, Reset, Restart, or "Force" movement).

Editing the Advanced Workflow structure (changing the flowchart, adding nodes, or modifying logic) cannot be done within the Troubleshooting tool. Workflow design changes must be made in the Application Builder under the Workflow tab. Attempting to "fix" a logic error by changing the design is a development task, whereas the Troubleshooting tool is an administrative task for existing data. Furthermore, editing a workflow requires saving a new version and potentially migrating active jobs, a process entirely separate from the record-level "Reset/Cancel" functions found in the Job Troubleshooting interface.

#### NEW QUESTION # 57
