Utilizing Reliable PCA Exam Sample - Get Rid Of Prometheus Certified Associate Exam

Many people choose to sign up for the Linux Foundation PCA certification examinations in order to advance their knowledge and abilities. We offer updated and actual Linux Foundation PCA Dumps questions that will be enough to get ready for the Linux Foundation PCA test. Our Linux Foundation PCA questions are 100% genuine and will certainly appear in the next Linux Foundation PCA test.

Linux Foundation Prometheus Certified Associate Exam Sample Questions (Q27-Q32):

NEW QUESTION # 27

What does the `evaluation_interval` parameter in the Prometheus configuration control?

- A. How often Prometheus evaluates recording and alerting rules.
- B. How often Prometheus sends metrics to remote storage.
- C. How often Prometheus compacts the TSDB data blocks.
- D. How often Prometheus scrapes targets.

Answer: A

Explanation:

The `evaluation_interval` parameter defines how frequently Prometheus evaluates its recording and alerting rules. It determines the schedule at which the rule engine runs, checking whether alert conditions are met and generating new time series for recording rules. For example, setting:

global:

```
evaluation_interval: 30s
```

means Prometheus evaluates all configured rules every 30 seconds. This setting differs from `scrape_interval`, which controls how often Prometheus collects data from targets.

Having a proper evaluation interval ensures alerting latency is balanced with system performance.

NEW QUESTION # 28

What is the best way to expose a timestamp from your application?

- A. With a gauge that has the timestamp as value.
- B. With a counter that is increased to the correct value.
- C. With a constant metric of value 1 and the timestamp as metric timestamp.
- D. With a constant metric of value 1 and the timestamp as label.

Answer: A

Explanation:

The correct way to expose a timestamp from an application in Prometheus is to use a gauge metric where the timestamp value (in Unix time, seconds since epoch) is stored as the metric's value. This approach aligns with the Prometheus data model, which discourages embedding timestamps as labels or metadata.

Example:

```
app_last_successful_backup_timestamp_seconds 1.696358e+09
```

In this example, the gauge represents the timestamp of the last successful backup. The `_seconds` suffix indicates the unit of measurement, making the metric self-descriptive. Prometheus automatically assigns timestamps to scraped samples, so the metric's value is treated purely as data, not as a Prometheus sample time.

Options B and D are incorrect because Prometheus does not allow arbitrary timestamps or labels for time values. Option C is incorrect since counters are monotonically increasing and not suited for discrete timestamp values.

NEW QUESTION # 29

The following is a list of metrics exposed by an application:

```
http_requests_total{code="500"} 10
```

```
http_requests_total{code="200"} 20
```

```
http_requests_total{code="400"} 30
```

```
http_requests_total{verb="POST"} 30
```

```
http_requests_total{verb="GET"} 30
```

What is the issue with the metric family?

- A. The value represents two different things across the dimensions: code and verb.
- B. Metric names are missing a prefix to indicate which application is exposing the query.

Answer: A

Explanation:

Prometheus requires that a single metric name represents one well-defined thing, and all time series in that metric share the same set of label keys so the value's meaning is consistent across dimensions. The official guidance states that metrics should not "mix different dimensions under the same name," and that a metric name should have a consistent label schema; otherwise, "the same metric name would represent different things," making queries ambiguous and aggregations error-prone. In the example,

`http_requests_total{code="..."}` expresses per-status-code request counts, while `http_requests_total{verb="..."}` expresses per-HTTP-method request counts. Because some series have only code and others only verb, the value changes its meaning across label sets, violating the consistency principle for a metric family. The correct approach is to expose one metric with both labels present on

every series, e.g., `http_requests_total{code="200", method="GET"}`, ensuring every time series has the same label keys and the value always means "count of requests," sliced by the same dimensions. A missing application prefix is optional and not the core issue here.

NEW QUESTION # 30

Which of the following is a valid metric name?

- A. `go_goroutines`
- B. `go.goroutines`
- C. `99_goroutines`
- D. `go routines`

Answer: A

Explanation:

According to Prometheus naming rules, metric names must match the regex `[a-zA-Z_][a-zA-Z0-9_]*`. This means metric names must begin with a letter, underscore, or colon, and can only contain letters, digits, and underscores thereafter.

The valid metric name among the options is `go_goroutines`, which follows all these rules. It starts with a letter (g), uses underscores to separate words, and contains only allowed characters.

By contrast:

`go routines` is invalid because it contains a space.

`go.goroutines` is invalid because it contains a dot (.), which is reserved for recording rule naming hierarchies, not metric identifiers.

`99_goroutines` is invalid because metric names cannot start with a number.

Following these conventions ensures compatibility with PromQL syntax and Prometheus' internal data model.

NEW QUESTION # 31

Which Alertmanager feature prevents duplicate notifications from being sent?

- A. Grouping
- B. Inhibition
- C. **Deduplication**
- D. Silencing

Answer: C

Explanation:

Deduplication in Alertmanager ensures that identical alerts from multiple Prometheus servers or rule evaluations do not trigger duplicate notifications.

Alertmanager compares alerts based on their labels and fingerprints; if an alert with identical labels already exists, it merges or refreshes the existing one instead of creating a new notification.

This mechanism is essential in high-availability setups where multiple Prometheus instances monitor the same targets.
