When it comes to buying something online (for example, HPE7-A01 exam torrent), people who are concerned with privacy protection are often concerned about their personal information during the purchase process. However, we ensure that we have provided you with an appropriate procurement process and the personal information of customer who using our HPE7-A01 test prep will be securely protected. In order to ensure the security of client information, our company hired many experts to design a secure procurement process for our HPE7-A01 Test Prep. If you decide to purchase our HPE7-A01 quiz guide, you can download the app of our products with no worry. Our HPE7-A01 exam torrent is absolutely safe and virus-free.

HP HPE7-A01 exam is a certification exam for individuals who are interested in becoming Aruba Certified Campus Access Professionals. Aruba Certified Campus Access Professional Exam certification is designed to validate the skills and knowledge required to configure and manage networks in a campus environment using Aruba products and technologies. HPE7-A01 Exam focuses on topics such as network access control, mobility, and security.

HP Aruba Certified Campus Access Professional Exam Sample Questions (Q28-Q33):

NEW QUESTION # 28

Your customer currently has two (2) 5406 modular switches with MSTP configured as their core switches. You are proposing a new solution. What would you explain regarding the Aruba CX VSX switch pair when the Primary VSX node is replaced and the system MAC is replaced?

- A. During the initial VSX configuration, the system-mac is assigned with a fixed MAC based on VSX ID.
- B. VSX will select the MAC address from a node that is a higher ID.
- C. VSX will select the MAC address from a node that is the lower ID.
- D. Configure vMAC on the Primary VSX node under VSX to retain MAC after hardware replacement.

Answer: A

Explanation:

The system-mac command is used to configure a fixed MAC address for the VSX system. This MAC address is used as the source MAC address for all routed traffic from the VSX node. The system-mac command is highly recommended for preventing traffic disruptions when the primary VSX switch restores after the secondary VSX switch, such as during a primary switch hardware replacement or a power outage. During the initial VSX configuration, the system-mac is assigned with a fixed MAC based on VSX ID. The system-mac command can be used to change this default MAC address if needed. Therefore, answer D is correct.

NEW QUESTION # 29

Your Director of Security asks you to assign AOS-CX switch management roles to new employees based on their specific job requirements. After the configuration was complete, it was noted that a user assigned with the auditors role did not have the appropriate level of access on the switch. The user was not allowed to perform firmware upgrades and a privilege level of 15 was not assigned to their role. Which default management role should have been assigned for the user?

- A. sysadmin
- B. config
- C. administrators
- D. sysops

Answer: D

Explanation:

The sysops user role is a predefined role that allows users to perform system operations on the switch, such as backup, restore, upgrade, or reboot. The sysops user role also has access to the PUT and POST methods for REST API, which can be used to modify the switch configuration.

The sysops user role has a privilege level of 15, which is the highest level of access on the switch.

NEW QUESTION # 30

Drag and Drop Question

What is the order of operations for Key Management service for a wireless client roaming from AP1 to AP2?

Answer:

Explanation:

NEW QUESTION # 31

A large retail client is looking to generate a rich set of contextual data based on the location information of wireless clients in their stores Which standard uses Round Trip Time (RTT) and Fine Time Measurements (FTM) to calculate the distance a client is from an AP?

- A. 802.11mc
- B. 802.11be
- C. 802.11ah
- D. 802.11V

Answer: A

Explanation:

802.11mc is a standard that uses Round Trip Time (RTT) and Fine Time Measurements (FTM) to calculate the distance a client is from an AP. 802.11mc defines a protocol for exchanging FTM frames between an AP and a client, which contain timestamps that indicate when the frames were transmitted and received. By measuring the RTT of these frames, the AP or the client can estimate their distance based on the speed of light. The other options are incorrect because they either do not use RTT or FTM or do not exist as standards. References:

NEW QUESTION # 32

Refer to Exhibit. With Access-1, what needs to be identically configured With MSTP to load- balance VLANS?

- A. spanning-tree Cist mapping
- B. Spanning-tree instance vlan mappjng
- C. Spanning-tree bpdu-guard setting
- D. Spanning-tree root-guard setting

Answer: B

Explanation:

To load-balance VLANs with MSTP, you need to configure the same VLAN-to-instance mapping on all switches in the same MST region. This means that you need to assign different VLANs to different MST instances, and then adjust the spanning tree parameters (such as priority, cost, or port role) for each instance to achieve the desired load balancing. For example, you can make one switch the root for instance 1 and another switch the root for instance 2, and then map half of the VLANs to instance 1 and the other half to instance 2.
