The Salesforce Certified Tableau Server Administrator (Analytics-Admn-201) PDF format, desktop practice test software, and web-based practice test software, all three formats of actual exam questions are ready for quick download. You just need to pay the affordable Salesforce Analytics-Admn-201 Exam Questions charges and click on the download button. Get them now and start Salesforce Certified Tableau Server Administrator (Analytics-Admn-201) exam preparation today.

Salesforce Analytics-Admn-201 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Administration: This section of the exam measures the skills of Tableau Administrators and covers the day-to-day tasks of maintaining Tableau Server. Candidates should understand how to create and manage schedules, subscriptions, backups, and restores, as well as how to use tools such as TSM, Tabcmd, and REST API. It emphasizes monitoring, server analysis, log file usage, and embedding practices. It also includes managing projects, sites, and nested structures, while contrasting end-user and administrator abilities. Knowledge of publishing, web authoring, sharing views, caching, and data source certification is also tested.
Topic 2	<ul style="list-style-type: none"> Installation and Configuration: This section of the exam measures the skills of Server Engineers and covers the process of installing Tableau Server, understanding installation paths, identity store options, SSO integrations, SSL setup, and silent installs. Candidates also need to demonstrate the ability to configure Tableau Server by setting cache, distributing processes, customizing sites, and configuring user quotas. It further includes adding users, managing their roles and permissions, and applying Tableau's security model at different levels from sites to workbooks.
Topic 3	<ul style="list-style-type: none"> Troubleshooting: This section of the exam measures the skills of Support Specialists and covers resolving common Tableau Server issues. Candidates must know how to reset accounts, package logs, validate site resources, rebuild search indexes, and use analysis reports. It also includes understanding the role of browser cookies and creating support requests when needed.
Topic 4	<ul style="list-style-type: none"> Connecting to and Preparing Data: This section of the exam measures the skills of Tableau Administrators and covers the basic understanding of Tableau Server's interface, navigation, and overall topology. Candidates are expected to recognize both client and server components, understand how these interact, and know where to find information about versions, releases, and updates. It also focuses on system requirements, including hardware, operating systems, browsers, email configurations, cloud considerations, and licensing models. Additionally, it examines knowledge of server processes, data source types, network infrastructure, and ports needed for a stable deployment.

Topic 5	<ul style="list-style-type: none"> • Migration & Upgrade: This section of the exam measures the skills of System Engineers and covers the process of upgrading and migrating Tableau Server environments. Candidates should understand how to carry out clean reinstalls, migrate servers to new hardware, and maintain backward compatibility during the process.

Salesforce Analytics-Admn-201 Marvelous Exam Answers

The development of science and technology makes our life more comfortable and convenient, which also brings us more challenges. Many company requests candidates not only have work experiences, but also some professional certifications. Therefore it is necessary to get a professional Analytics-Admn-201 Certification to pave the way for a better future. Considered many of the candidates are too busy to review, our experts designed the Analytics-Admn-201 question dumps in accord with actual examination questions, which would help you pass the exam with high proficiency.

Salesforce Certified Tableau Server Administrator Sample Questions (Q33-Q38):

NEW QUESTION # 33

You have an existing group subscription. You add a user to the group. What statement correctly describes the result?

- A. The subscription will continue to include only the members of the group at the time the subscription was made
- B. The creator of the subscription receives notice of the change and must manually edit the subscription to reflect the new group membership
- C. The administrator receives a notice to approve or deny adding the user to the subscription
- **D. The subscription updates automatically to include the new user**

Answer: D

Explanation:

Subscriptions in Tableau Server deliver workbook views to users via email on a schedule. Group subscriptions apply to all group members-let's unpack this:

* Group Subscription Mechanics:

* Created via Workbooks > Actions > Subscribe > Select Group.

* Delivers content to all users in the group at the time the subscription runs (e.g., daily PDF).

* Dynamic: Membership updates (additions/removals) are reflected automatically on the next run.

* Option C (The subscription updates automatically to include the new user): Correct.

* Details: When you add a user to the group (e.g., via Users > Groups > Add Users), Tableau Server's subscription process queries the group's current membership at runtime. The new user receives the subscription on the next scheduled delivery-no manual action needed.

* Example: Group "Sales" has a 9 AM subscription. Add a user at 8 AM-they get the email tomorrow at 9 AM.

* Option A (Admin receives notice to approve/deny): Incorrect.

* Why: No approval workflow exists for group membership changes in subscriptions-it's automatic.

* Option B (Creator must manually edit): Incorrect.

* Why: Subscriptions are tied to the group, not a static user list-manual edits aren't required for membership changes.

* Option D (Only members at creation time): Incorrect.

* Why: This would be true for individual subscriptions (static list), but group subscriptions are dynamic.

Why This Matters: Dynamic group subscriptions streamline content delivery as teams evolve, reducing admin overhead.

Reference: Tableau Server Documentation - "Manage Subscriptions" (<https://help.tableau.com/current/server/en-us/subscribe.htm>).

NEW QUESTION # 34

What are two intervals when Tableau Server verifies if data conditions for data-driven alerts are true? (Choose two.)

- A. Whenever a new extract is published
- **B. Whenever extracts in the related workbook are refreshed**

- C. Every 10 minutes
- D. Every 60 minutes

Answer: B,D

Explanation:

Data-driven alerts notify users when data meets conditions (e.g., sales > \$10K). Let's examine when Tableau checks these:

- * Alert Mechanics:
- * Enabled per site (Settings > General > Data-Driven Alerts).
- * Backgrounder evaluates conditions against extract data.
- * Check Intervals: Configurable via tsm configuration set -k dataAlerts.checkIntervalInMinutes (default: 60 minutes).
- * Refresh Trigger: Also checks post-extract refresh for immediate updates.
- * Option A (Every 60 minutes): Correct.
- * Details: Default interval-Backgrounder polls every hour to evaluate alert conditions.
- * Config: Adjustable (e.g., -v 30 for 30 minutes).
- * Option D (Whenever extracts in the related workbook are refreshed): Correct.
- * Details: An extract refresh updates the data, triggering an immediate alert check to catch changes promptly.
- * Why: Ensures timely notifications without waiting for the next poll.
- * Option B (Every 10 minutes): Incorrect.
- * Why: Not the default-possible via config, but not standard.
- * Option C (Whenever a new extract is published): Incorrect.
- * Why: Publishing creates the extract; alerts trigger on refreshes or polling, not initial publication.

Why This Matters: Timing affects alert responsiveness-balancing frequency and server load is key.

Reference: Tableau Server Documentation - "Data-Driven Alerts" (https://help.tableau.com/current/server/en-us/data_alerts.htm).

NEW QUESTION # 35

What process enables you to access Tableau Services Manager (TSM) over HTTPS?

- A. Administration Controller
- B. Coordination Service
- C. Administration Agent
- D. License Manager

Answer: A

Explanation:

TSM is Tableau Server's management layer, accessible via CLI or web UI (port 8850). HTTPS secures this access-let's identify the responsible process:

- * TSM Architecture:
- * Administration Controller: Core TSM process, running on the initial node, handling configuration, UI, and CLI commands.
- * HTTPS: Enabled by default on port 8850 with a self-signed certificate (configurable to custom certs).
- * Option B (Administration Controller): Correct.
- * Details: Hosts the TSM web UI (<https://<server>:8850>) and processes CLI requests. It manages the HTTPS listener, serving the interface securely.
- * Why: It's the central hub for TSM operations, including secure access.
- * Option A (License Manager): Incorrect.
- * Why: Validates licenses, not responsible for HTTPS or UI access.
- * Option C (Administration Agent): Incorrect.
- * Why: Runs on additional nodes in multi-node setups to relay commands to the Controller-no direct HTTPS role.
- * Option D (Coordination Service): Incorrect.
- * Why: ZooKeeper manages cluster state, not TSM's web interface or HTTPS.

Why This Matters: Secure TSM access protects server administration-Administration Controller is the linchpin.

Reference: Tableau Server Documentation - "TSM Overview" (https://help.tableau.com/current/server/en-us/tsm_overview.htm).

NEW QUESTION # 36

Which three types of data should you backup to ensure that you can restore a Tableau Server? (Choose three.)

- A. Configuration data

- B. Repository data
- C. Server secrets and Repository passwords
- D. Topology data

Answer: A,B,C

Explanation:

Backing up Tableau Server ensures recovery from failures or migrations. A full backup includes multiple data types-let's dissect this comprehensively:

* Backup Components:

* Repository Data: PostgreSQL database with metadata (users, permissions, workbooks). Backed up via tsm maintenance backup -f<filename>.tsbak.

* Configuration Data: Server settings (e.g., ports, authentication) also in the .tsbak file.

* Server Secrets: Encryption keys, internal tokens, Repository passwords-critical for restoring functionality.

* Extracts: .hyper files in File Store (optional, separate backup).

* Option A (Server secrets and Repository passwords): Correct.

* Details: Includes encryption keys (for extracts), internal tokens (process communication), and Repository credentials. Backed up separately or stored securely (e.g., tsm security export-keys).

* Why Critical: Without these, restored data may be inaccessible or services may fail.

* Option C (Configuration data): Correct.

* Details: Ports, authentication settings, process topology-part of the .tsbak file.

* Why Critical: Restores server behavior and connectivity post-recovery.

* Option D (Repository data): Correct.

* Details: Core metadata database-also in .tsbak.

* Why Critical: Without it, all content and user data is lost.

* Option B (Topology data): Incorrect.

* Details: Topology (process distribution) is part of configuration data in the .tsbak, not a separate entity. It's not distinctly backed up as "topology data." Why This Matters: A complete backup (secrets, config, repository) ensures full restoration-missing any piece risks an unusable server.

Reference: Tableau Server Documentation - "Back Up Tableau Server Data" (https://help.tableau.com/current/server/en-us/backup_restore.htm).

NEW QUESTION # 37

You have a server that contains 16 processor cores. What is the default number of VizQL instances configured by the installer?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: B

Explanation:

The VizQL Server process in Tableau Server handles rendering visualizations and processing queries for users viewing dashboards or workbooks. During installation, Tableau Server automatically configures the number of VizQL instances based on the number of processor cores on the machine, following this rule:

Default VizQL instances = 2 per node, unless manually adjusted post-installation.

In multi-node setups, additional instances may be added based on core count, but the question specifies a single server with 16 cores.

The installer does not scale VizQL instances linearly with core count by default (e.g., it doesn't set 1 instance per 4 cores). Instead: For a single-node installation, the default is 2 VizQL instances, regardless of core count (assuming the minimum hardware requirements are met: 8 cores, 32 GB RAM).

Administrators can later adjust this using TSM (e.g., tsm topology set-process) based on performance needs, but the question asks for the default configured by the installer.

Option A (4): Incorrect. Four instances might be configured manually for a 16-core server, but it's not the default.

Option B (6): Incorrect. Six instances exceed the default for a single node.

Option C (10): Incorrect. Ten instances are far beyond the default and would require manual configuration.

Option D (2): Correct. The installer sets 2 VizQL instances by default on a single-node installation.

Reference: Tableau Server Documentation - "Server Process Settings" (<https://help.tableau.com/current/server/en-us/processes.htm>).

NEW QUESTION # 38

.....

The services provided by our Analytics-Admn-201 test questions are quite specific and comprehensive. First of all, our test material comes from many experts. The gold content of the materials is very high, and the updating speed is fast. By our Analytics-Admn-201 exam prep, you can find the most suitable information according to your own learning needs at any time, and make adjustments and perfect them at any time. Our Analytics-Admn-201 Learning Materials not only provide you with information, but also for you to develop the most suitable for your learning schedule, this is tailor-made for you, according to the timetable to study and review. I believe you can improve efficiency.
