

SnowPro Advanced Architect Certification Latest Test Cram & ARA-C01 exam study guide & SnowPro Advanced Architect Certification detail study guides

DOWNLOAD the newest PremiumVCEDump ARA-C01 PDF dumps from Cloud Storage for free:
<https://drive.google.com/open?id=18kFgDOLKrUG6AlbzmeGAKXTxgjapos3q>

With the help of our ARA-C01 Latest Dumps Pdf, you just need to spend one or two days to practice the ARA-C01 training materials. If you remember the key points of study guide, you will pass the real exam with hit-rate. You can trust us about the valid and accuracy of Snowflake braindumps because it created by our experienced workers and based on the real questions.

Snowflake ARA-C01 exam is a vendor-neutral certification that is recognized globally. It is designed to validate the skills and knowledge of professionals in Snowflake architecture and design, making them more competitive in the job market. Passing the exam demonstrates that a candidate has a deep understanding of Snowflake and can design and implement complex Snowflake solutions with high levels of efficiency, scalability, and security. Overall, the Snowflake ARA-C01 exam is an excellent opportunity for professionals who want to advance their careers in Snowflake architecture and design.

Earning the Snowflake ARA-C01 Certification demonstrates your proficiency in designing and implementing complex data solutions using Snowflake's cloud data platform. It is a testament to your expertise in data warehousing, data integration, and data analytics. SnowPro Advanced Architect Certification certification is recognized globally and provides a competitive advantage in the job market. It also helps you stand out as a leader in the field of data engineering, data architecture, and data management.

Snowflake ARA-C01 Visual Cert Test - ARA-C01 Practice Engine

The PremiumVCEDump is one of the top-rated and trusted platforms that are committed to making the SnowPro Advanced Architect Certification (ARA-C01) certification exam journey successful. To achieve this objective PremiumVCEDump has hired a team of experienced and qualified Snowflake ARA-C01 Exam trainers. They work together and put all their expertise to maintain the top standard of ARA-C01 practice test all the time.

Snowflake ARA-C01 Certification is an advanced-level certification exam that is designed to validate the skills and knowledge of the candidates in the field of Snowflake data warehousing. SnowPro Advanced Architect Certification certification exam is intended for experienced professionals who have a deep understanding of Snowflake architecture, its various components, and their respective functionalities. SnowPro Advanced Architect Certification certification exam is an ideal choice for architects, consultants,

and data engineers who work with Snowflake on a daily basis.

Snowflake SnowPro Advanced Architect Certification Sample Questions (Q49-Q54):

NEW QUESTION # 49

Privileges granted on database objects are not replicated to a secondary database.

- A. FALSE
- B. TRUE

Answer: B

NEW QUESTION # 50

A media company needs a data pipeline that will ingest customer review data into a Snowflake table, and apply some transformations. The company also needs to use Amazon Comprehend to do sentiment analysis and make the de-identified final data set available publicly for advertising companies who use different cloud providers in different regions.

The data pipeline needs to run continuously and efficiently as new records arrive in the object storage leveraging event notifications. Also, the operational complexity, maintenance of the infrastructure, including platform upgrades and security, and the development effort should be minimal.

Which design will meet these requirements?

- A. Ingest the data into Snowflake using Amazon EMR and PySpark using the Snowflake Spark connector. Apply transformations using another Spark job. Develop a python program to do model inference by leveraging the Amazon Comprehend text analysis API. Then write the results to a Snowflake table and create a listing in the Snowflake Marketplace to make the data available to other companies.
- B. Ingest the data using Snowpipe and use streams and tasks to orchestrate transformations. Export the data into Amazon S3 to do model inference with Amazon Comprehend and ingest the data back into a Snowflake table. Then create a listing in the Snowflake Marketplace to make the data available to other companies.
- C. Ingest the data using copy into and use streams and tasks to orchestrate transformations. Export the data into Amazon S3 to do model inference with Amazon Comprehend and ingest the data back into a Snowflake table. Then create a listing in the Snowflake Marketplace to make the data available to other companies.
- D. Ingest the data using Snowpipe and use streams and tasks to orchestrate transformations. Create an external function to do model inference with Amazon Comprehend and write the final records to a Snowflake table. Then create a listing in the Snowflake Marketplace to make the data available to other companies.

Answer: D

Explanation:

Option B is the best design to meet the requirements because it uses Snowpipe to ingest the data continuously and efficiently as new records arrive in the object storage, leveraging event notifications. Snowpipe is a service that automates the loading of data from external sources into Snowflake tables¹. It also uses streams and tasks to orchestrate transformations on the ingested data. Streams are objects that store the change history of a table, and tasks are objects that execute SQL statements on a schedule or when triggered by another task².

Option B also uses an external function to do model inference with Amazon Comprehend and write the final records to a Snowflake table. An external function is a user-defined function that calls an external API, such as Amazon Comprehend, to perform computations that are not natively supported by Snowflake³. Finally, option B uses the Snowflake Marketplace to make the de-identified final data set available publicly for advertising companies who use different cloud providers in different regions. The Snowflake Marketplace is a platform that enables data providers to list and share their data sets with data consumers, regardless of the cloud platform or region they use⁴.

Option A is not the best design because it uses copy into to ingest the data, which is not as efficient and continuous as Snowpipe. Copy into is a SQL command that loads data from files into a table in a single transaction. It also exports the data into Amazon S3 to do model inference with Amazon Comprehend, which adds an extra step and increases the operational complexity and maintenance of the infrastructure.

Option C is not the best design because it uses Amazon EMR and PySpark to ingest and transform the data, which also increases the operational complexity and maintenance of the infrastructure. Amazon EMR is a cloud service that provides a managed Hadoop framework to process and analyze large-scale data sets.

PySpark is a Python API for Spark, a distributed computing framework that can run on Hadoop. Option C also develops a python program to do model inference by leveraging the Amazon Comprehend text analysis API, which increases the development effort.

Option D is not the best design because it is identical to option A, except for the ingestion method. It still exports the data into

Amazon S3 to do model inference with Amazon Comprehend, which adds an extra step and increases the operational complexity and maintenance of the infrastructure.

NEW QUESTION # 51

An Architect needs to grant a group of ORDER_ADMIN users the ability to clean old data in an ORDERS table (deleting all records older than 5 years), without granting any privileges on the table. The group's manager (ORDER_MANAGER) has full DELETE privileges on the table.

How can the ORDER_ADMIN role be enabled to perform this data cleanup, without needing the DELETE privilege held by the ORDER_MANAGER role?

- A. Create a stored procedure that runs with owner's rights, including the appropriate "> 5 years" business logic, and grant USAGE on this procedure to ORDER_ADMIN. The ORDER_MANAGER role owns the procedure.
- B. Create a stored procedure that can be run using both caller's and owner's rights (allowing the user to specify which rights are used during execution), and grant USAGE on this procedure to ORDER_ADMIN. The ORDER_MANAGER role owns the procedure.
- C. This scenario would actually not be possible in Snowflake - any user performing a DELETE on a table requires the DELETE privilege to be granted to the role they are using.
- D. Create a stored procedure that runs with caller's rights, including the appropriate "> 5 years" business logic, and grant USAGE on this procedure to ORDER_ADMIN. The ORDER_MANAGER role owns the procedure.

Answer: A

Explanation:

This is the correct answer because it allows the ORDER_ADMIN role to perform the data cleanup without needing the DELETE privilege on the ORDERS table. A stored procedure is a feature that allows scheduling and executing SQL statements or stored procedures in Snowflake. A stored procedure can run with either the caller's rights or the owner's rights. A caller's rights stored procedure runs with the privileges of the role that called the stored procedure, while an owner's rights stored procedure runs with the privileges of the role that created the stored procedure. By creating a stored procedure that runs with owner's rights, the ORDER_MANAGER role can delegate the specific task of deleting old data to the ORDER_ADMIN role, without granting the ORDER_ADMIN role more general privileges on the ORDERS table. The stored procedure must include the appropriate business logic to delete only the records older than 5 years, and the ORDER_MANAGER role must grant the USAGE privilege on the stored procedure to the ORDER_ADMIN role. The ORDER_ADMIN role can then execute the stored procedure to perform the data cleanup.

NEW QUESTION # 52

When would you usually consider to add clustering key to a table

- A. The performance of the query has deteriorated over a period of time.
- B. The table has more than 20 columns
- C. The number of users querying the table has increased
- D. It is a multi-terabyte size table

Answer: A,D

NEW QUESTION # 53

Several in-house applications need to connect to Snowflake without browser access or redirect capabilities.

What is the Snowflake best practice for authentication?

- A. Use key pair authentication with a service user.
- B. Use Snowflake OAuth.
- C. Use usernames and passwords.
- D. Use external OAuth.

Answer: A

Explanation:

For non-interactive, service-to-service authentication scenarios, Snowflake recommends key pair authentication using a service user (Answer D). This method avoids hardcoding passwords, supports automated rotation of credentials, and aligns with security best practices.

OAuth-based methods typically require browser redirects or user interaction, which are not available in this scenario.

Username/password authentication introduces security risks and operational overhead.

Key pair authentication enables strong, certificate-based security and is widely used in SnowPro Architect designs for applications, ETL tools, and automated workloads.
