### Cisco Certified Support Technician (CCST) IT Support Sample Questions (Q68-Q73):

#### NEW QUESTION # 68

During performance assessments, a technician wishes to determine the number of hops and the latency at each hop from their network to a remote IPv6 web service. Which command would provide the most detailed information?

- A. arp -a6
- B. ping6 www.example.com
- C. traceroute6 www.example.com
- D. ipconfig /all6

**Answer: C**

Explanation:

Correct Answer. B. traceroute6 www.example.com traceroute6 enables the technician to view each hop the packets make on their way to the destination, along with the time taken at each hop, providing a detailed view of the path and performance.

Option A is incorrect. While ping6 provides latency data to the destination, it lacks detailed per-hop information.

Option C is incorrect. ipconfig /all6 does not exist as a command; ipconfig /all displays network configuration for interfaces but does not trace routes.

Option D is incorrect. arp -a6 is a fictitious command; arp shows the IP to MAC address mappings and does not support IPv6 or provide routing diagnostics.

#### NEW QUESTION # 69

A user needs to reset their password based on feedback after a security concern.

You want to provide an example of a strong password to the user based on the following company guidelines shown:

Must have 8 to 15 characters

Must contain lowercase letters

Must contain at least 2 numbers

Must begin and end with a letter

Only special characters that can be used dash (-), underscore (\_), hashtag (#), and at sign (@) Which password could you use as an example?

- A. dkku546@
- B. j546h!Gg
- C. mkn546#f
- D. ywm546q

**Answer: C**

Explanation:

mkn546#f is 8 characters long (within 8-15), begins with "m" and ends with "f" (letters), includes only lowercase letters, contains three numbers (5, 4, 6), and uses only the allowed special character "#."

#### NEW QUESTION # 70

What should be done if there are multiple reports from employees about unauthorized access attempts on their accounts?

- A. Update antivirus software on all company devices
- B. Conduct a security audit to identify and address any vulnerabilities
- C. Encourage employees to use more complex passwords without additional actions

- D. Advise employees to not use their accounts until further notice

**Answer: B**

Explanation:

Correct Answer. C. Conduct a security audit to identify and address any vulnerabilities A security audit helps to comprehensively assess and mitigate risks associated with unauthorized access attempts, identifying potential weaknesses in the system's security posture.

Option A is incorrect as ceasing all account usage is impractical and may hinder business operations.

Option B is incorrect because updating antivirus software, while important, does not directly address unauthorized access to accounts.

Option D is incorrect because merely using complex passwords is insufficient without a broader security review and response plan.

#### NEW QUESTION # 71

What should be avoided when creating passwords to ensure they remain secure?

- A. Using a different password for each account
- B. Using long, complex passwords
- C. Including sequential letters or numbers
- D. Regularly updating passwords every few months

**Answer: C**

Explanation:

Correct Answer. C. Including sequential letters or numbers Sequential letters or numbers (like "abcd" or "1234") are predictable and often used in weak passwords, making them easier for attackers to guess.

Option A is incorrect as it is recommended to update passwords regularly to mitigate the risk of long-term exposure Option B is incorrect because using different passwords for each account prevents a single breach from compromising multiple accounts Option D is incorrect as long, complex passwords are recommended to enhance security

#### NEW QUESTION # 72

A user needs to ensure their computer's IP settings are not causing a conflict on the local network. What ipconfig command should the IT support technician instruct them to use to release and then renew their IP address?

- A. ipconfig /flushdns
- B. ipconfig /release followed by ipconfig /renew
- C. ipconfig /all
- D. ipconfig /renew followed by ipconfig /release

**Answer: B**

Explanation:

Correct Answer. A. ipconfig /release followed by ipconfig /renew Using ipconfig /release followed by ipconfig /renew is the correct procedure for releasing the current IP configuration and then requesting a new IP address from the DHCP server. This can resolve conflicts and refresh network settings on a device.

Option B is incorrect because renewing an IP address before releasing it does not address potential conflicts as the existing address might be retained.

Option C is incorrect because ipconfig /all only displays configuration details without making any changes to resolve conflicts.

Option D is incorrect because ipconfig /flushdns clears the DNS cache, which is unrelated to IP address conflicts on the network.
