CompTIA DataSys+ Certification Exam Sample Questions (Q113-Q118):

NEW QUESTION # 113

Gary is logging into a system and is providing his fingerprint to gain access. What step of the IAM process is he performing?

- A. Identification
- B. Authentication
- C. Authorization
- D. Accounting

Answer: B

NEW QUESTION # 114

Which of the following scripts would set the database recovery model for sys.database?

- A. ☐
- B. ☐
- C. ☐
- D. ☐

Answer: C

Explanation:

The script that would set the database recovery model for sys.database is option A. This script uses the ALTER DATABASE statement to modify the recovery model of the sys.database to full with no wait. The other options either have syntax errors, use incorrect keywords, or do not specify the recovery model correctly.

NEW QUESTION # 115

Which of the following is the best way to migrate a large data load from one table to another, considering total time and blocking?

- A. Split the load size in half and run simultaneously.
- B. Batch large loads into one transaction.
- C. Split the load size into many transactions.
- D. Batch into small loads and run in parallel.

Answer: D

Explanation:

The best way to migrate a large data load from one table to another, considering total time and blocking, is to batch into small loads and run in parallel. This means that the large data load is divided into smaller chunks that can be processed simultaneously by multiple threads or processes. This reduces the total time required for the migration and also minimizes the blocking of other operations on the tables involved. The other options are either less efficient or more prone to blocking. For example, splitting the load size into many transactions may increase the overhead and latency of each transaction; splitting the load size in half and running simultaneously may still cause blocking or contention; batching large loads into one transaction may take longer and lock the tables for longer periods. Reference: CompTIA DataSys+ Course Outline, Domain 3.0 Database Management and Maintenance, Objective 3.3 Given a scenario, migrate data between databases.

NEW QUESTION # 116

What technology may be used to perform disk-to-disk backups with systems designed to work only with tapes?

- A. VLAN
- **B. VTL**
- C. Journaling
- D. D2D

Answer: B

NEW QUESTION # 117

A database administrator set up a connection for a SQL Server instance for a new user, but the administrator is unable to connect using the user's workstation. Which of the following is the most likely cause of the issue?

- **A. The SQL Server ports to the main machine are closed.**
- B. The SQL Server has not been tested properly.
- C. The SQL Server has many concurrent users.
- D. The SQL Server codes are performing badly.

Answer: A

Explanation:

The most likely cause of the issue is that the SQL Server ports to the main machine are closed. SQL Server uses TCP/IP ports to communicate with clients and other servers. If these ports are blocked by a firewall or other network device, the connection will fail. The administrator should check the port configuration on both the server and the user's workstation, and make sure that they are open and match the expected values. The other options are either unlikely or unrelated to the issue. For example, the SQL Server codes performing badly or having many concurrent users may affect the performance or availability of the server, but not prevent the connection entirely; the SQL Server not being tested properly may cause errors or bugs in the functionality or security of the server, but not affect the connection unless there is a configuration problem. Reference: CompTIA DataSys+ Course Outline, Domain 2.0 Database Deployment, Objective 2.3 Given a scenario, troubleshoot common database deployment issues.
