最新的 Isaca Certification CISM 免費考試真題 (Q721-Q726):

問題 #721

What is the BEST way to ensure users comply with organizational security requirements for password complexity?

- A. Require each user to acknowledge the password requirements
- B. Include password construction requirements in the security standards
- C. Enable system-enforced password configuration
- D. Implement strict penalties for user noncompliance

答案: C

解題說明:

Automated controls are generally more effective in preventing improper actions. Policies and standards provide some deterrence, but are not as effective as automated controls.

問題 #722

Which of the following would BEST enable the timely execution of an incident response plan?

- A. The introduction of a decision support tool
- B. Definition of trigger events
- C. Centralized service desk
- D. Clearly defined data classification process

答案: B

問題 #723

The MOST important function of a risk management program is to:

- A. minimize residual risk.
- B. maximize the sum of all annualized loss expectancies (ALEs).
- C. eliminate inherent risk.
- D. quantify overall risk.

答案: A

解題說明:

Section: INFORMATION RISK MANAGEMENT

Explanation:

A risk management program should minimize the amount of risk that cannot be otherwise eliminated or transferred; this is the residual risk to the organization. Quantifying overall risk is important but not as critical as the end result. Eliminating inherent risk is virtually impossible. Maximizing the sum of all ALEs is actually the opposite of what is desirable.

問題 #724

Which of the following would be MOST effective in reducing the impact of a distributed denial of service (DDoS) attack?

- A. Impose state limits on servers.
- B. Harden network security.
- C. Spread a site across multiple ISPs.
- D. Block the attack at the source.

答案: C

解題說明:

Explanation

The answer to the question is B. Spread a site across multiple ISPs. This is because spreading a site across multiple Internet service providers (ISPs) can help to reduce the impact of a distributed denial of service (DDoS) attack by increasing the bandwidth and redundancy of the site, and making it harder for the attacker to target and overwhelm a single point of failure. Spreading a site across multiple ISPs can also help to distribute the traffic load and balance the performance of the site, and to mitigate the effects of regional or network-specific outages or disruptions. Spreading a site across multiple ISPs can be done by using various techniques, such as

anycast routing, content delivery networks (CDNs), or cloud-based services¹².

Spreading a site across multiple ISPs can help to reduce the impact of a DDoS attack by increasing the bandwidth and redundancy of the site, and making it harder for the attacker to target and overwhelm a single point of failure. 問題 #725

The MOST important factor in planning for the long-term retention of electronically stored business records is to take into account potential changes in:

- A. regulatory and legal requirements.
- B. storage capacity and shelf life.
- C. application systems and media.
- D. business strategy and direction.

答案： C

解題說明：

Long-term retention of business records may be severely impacted by changes in application systems and media. For example, data stored in nonstandard formats that can only be read and interpreted by previously decommissioned applications may be difficult, if not impossible, to recover. Business strategy and direction do not generally apply, nor do legal and regulatory requirements. Storage capacity and shelf life are important but secondary issues.
